DC/OS AND FAST DATA (THE SMACK STACK)

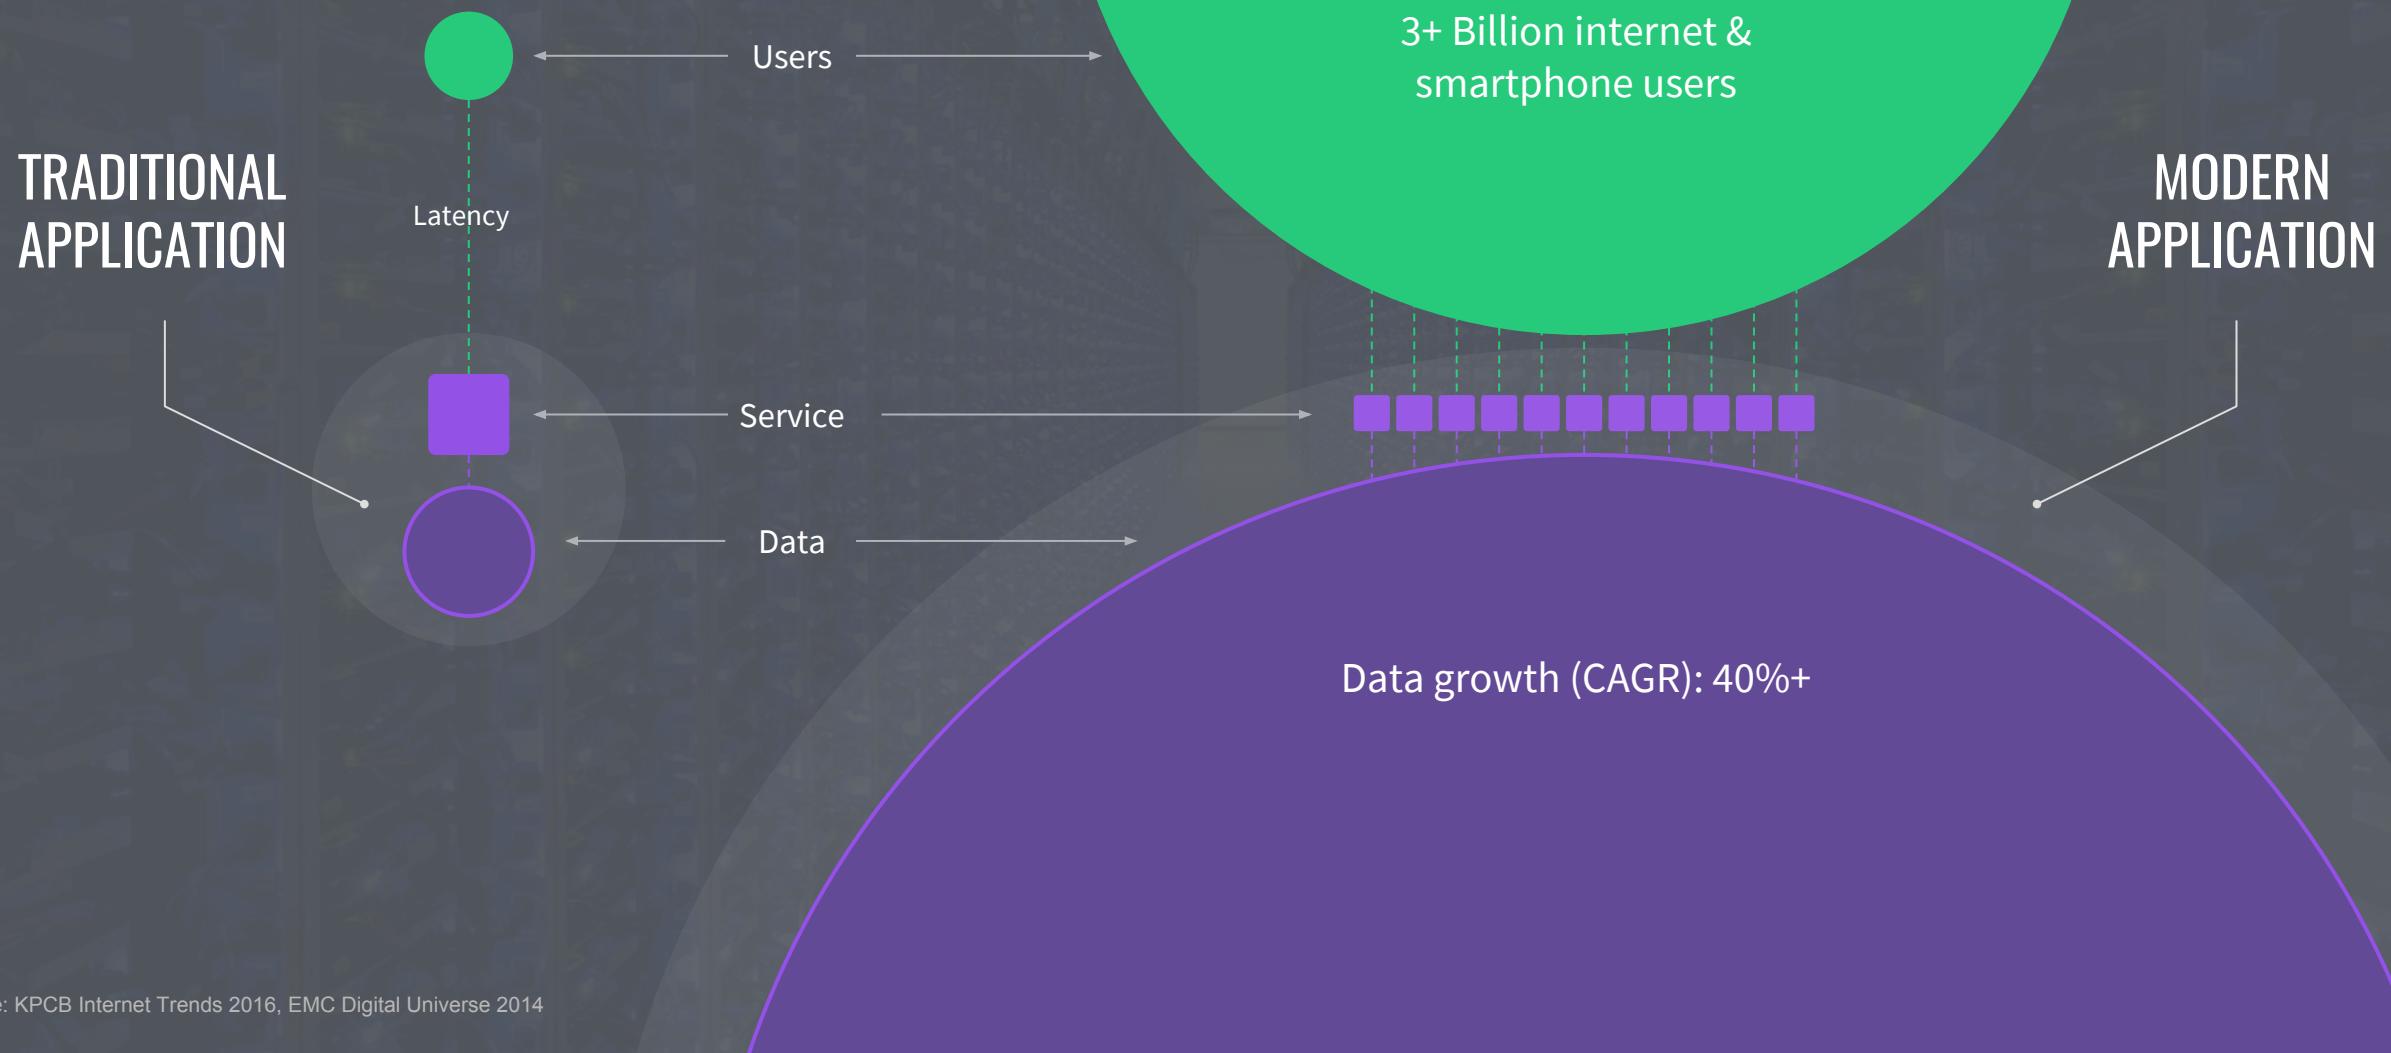

DC/OS

Benjamin Hindman - @benh

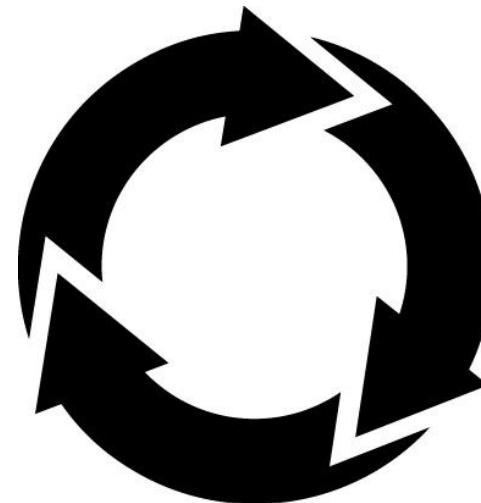

Elizabeth K. Joseph - @pleia2

ARCHITECTURAL SHIFT

TODAY'S REINFORCING TRENDS

CONTAINERIZATION

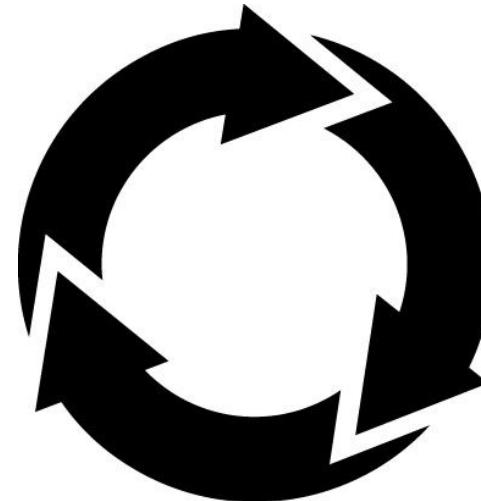

MICROSERVICES

CONTAINER ORCHESTRATION

BIG DATA & ANALYTICS

TODAY'S REINFORCING TRENDS

CONTAINERIZATION

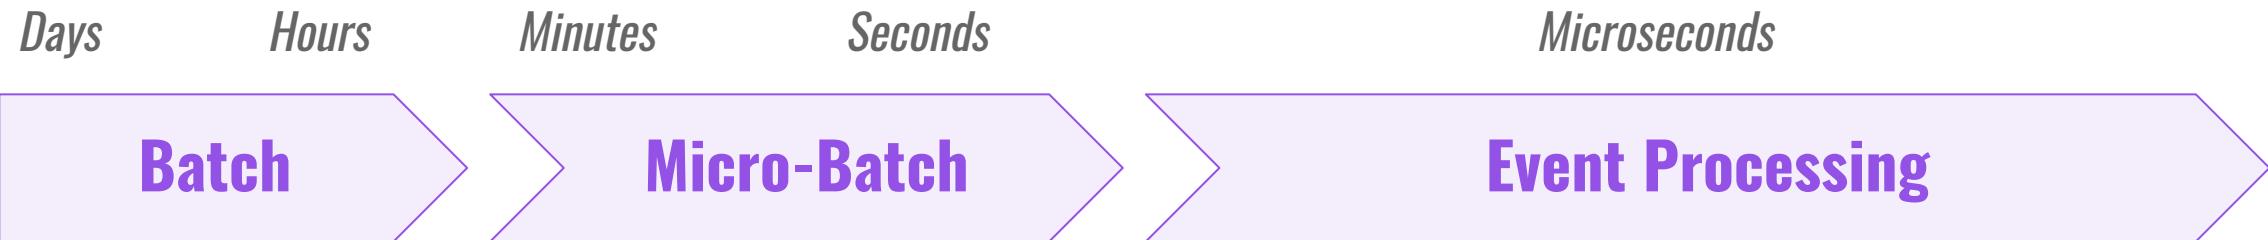

MICROSERVICES

CONTAINER ORCHESTRATION

FAST BIG DATA & ANALYTICS

FROM BIG DATA TO FAST DATA

Reports what has happened using descriptive analytics

Solves problems using predictive and prescriptive analytics

Billing, Chargeback

Product recommendations

Real-time Pricing and Routing

Real-time Advertising

Predictive User Interface

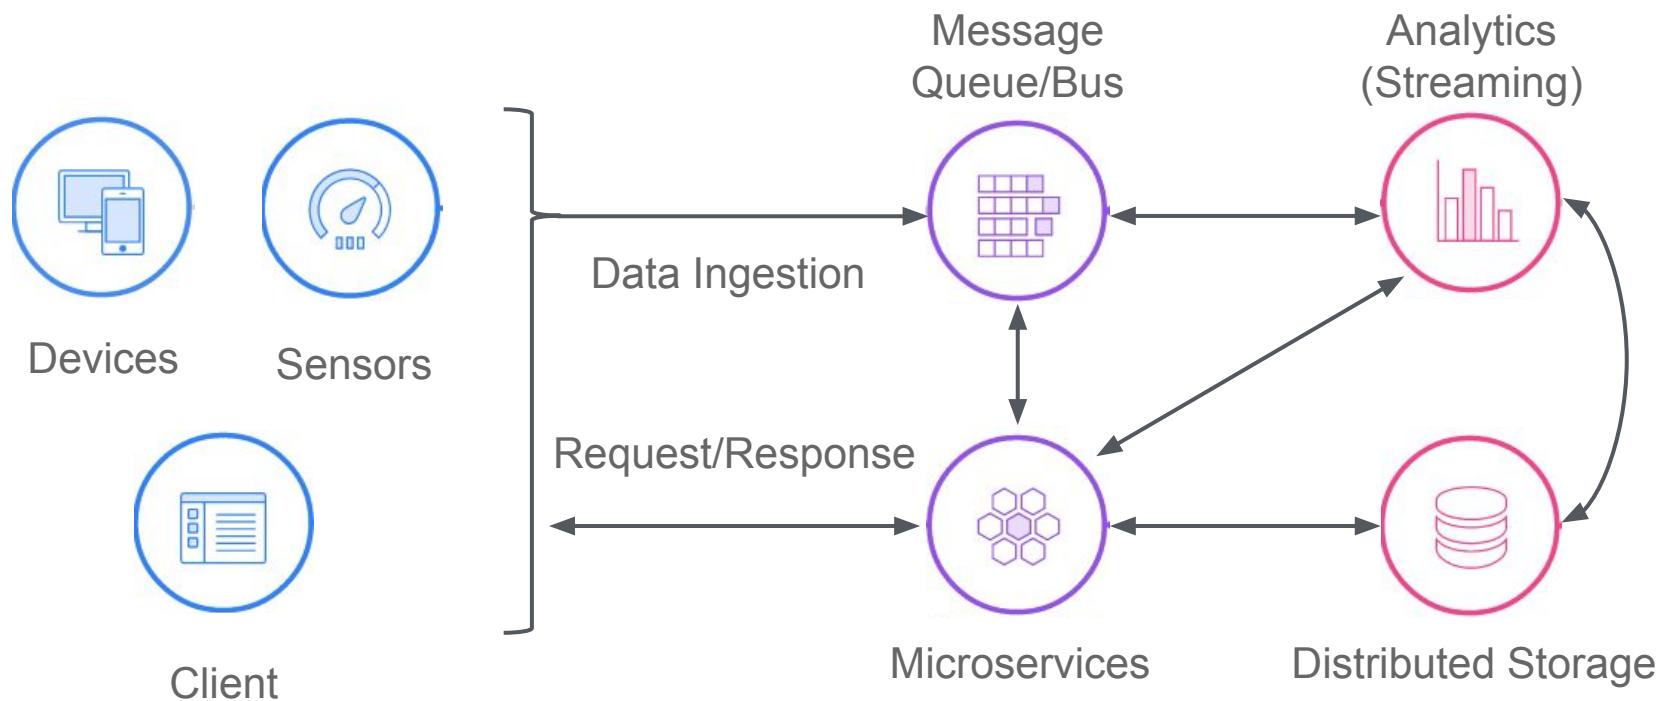

ON THE EDGE, AND STILL REALLY BIG!

A380-1000: 10,000 sensors in each wing;
produces more than 7Tb of IoT data per day

[1] <https://goo.gl/2S4q5N>

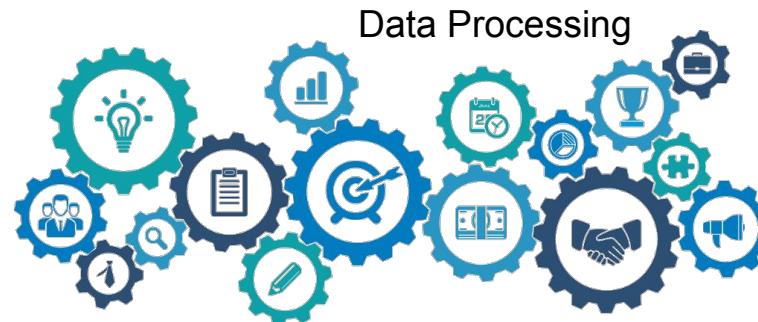

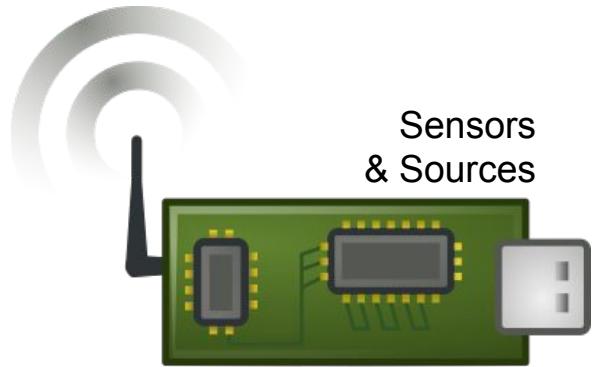

MODERN APPLICATION -> FAST DATA BUILT-IN

Use Cases:

- Anomaly detection
- Personalization
- IoT Applications
- Predictive Analytics
- Machine Learning

THE FOUNDATIONS OF FAST DATA

MESSAGE QUEUES

Message Brokers

- Apache Kafka
- ØMQ, RabbitMQ, Disque

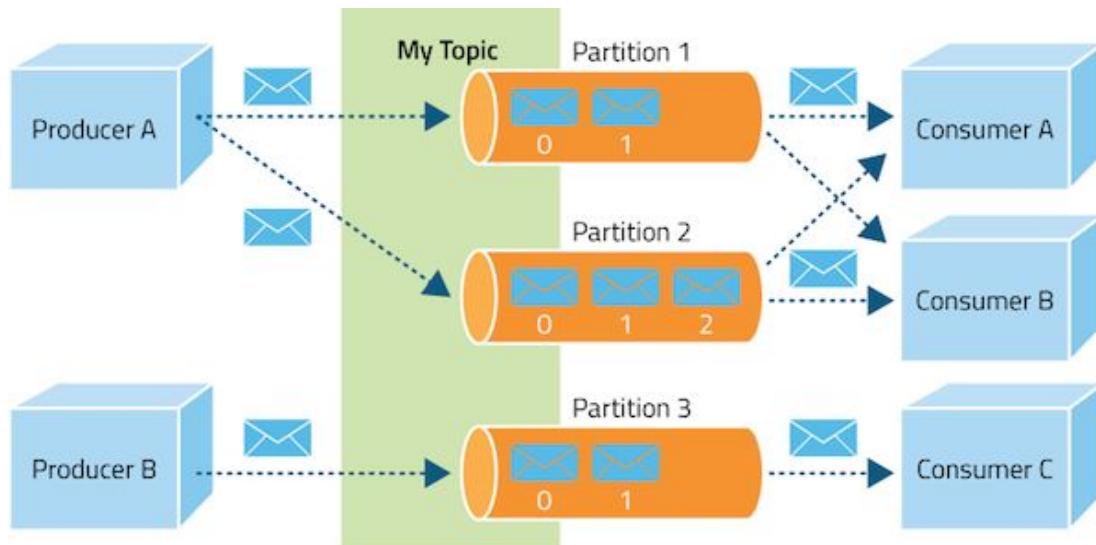

Log-based Queues

- fluentd, Logstash, Flume

see also [queues.io](#)

APACHE KAFKA

Typical Use: A reliable buffer for stream processing

Why Kafka?

- High-throughput, distributed, persistent publish-subscribe messaging system
- Created by LinkedIn; used in production by 100+ web-scale companies [1]

[1] <https://cwiki.apache.org/confluence/display/KAFKA/Powered+By>

DELIVERY GUARANTEES

- **At most once**—Messages may be lost but are never redelivered
- **At least once**—Messages are never lost but may be redelivered (Kafka)
- **Exactly once**—Messages are delivered once and only once (this is what everyone actually wants, but no one can deliver!)

Murphy's Law of Distributed Systems:

Anything that can go wrong, will go wrong ... partially!

STREAMING ANALYTICS

Microbatching

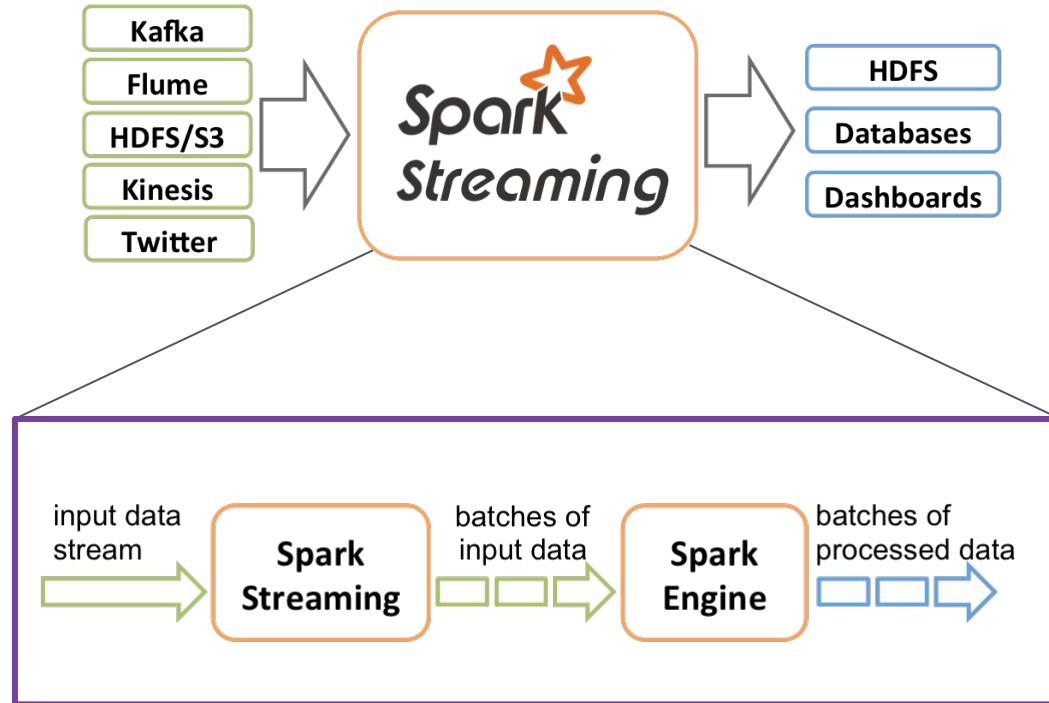

- Apache Spark (Streaming)

Native Streaming

- Apache Flink
- Apache Storm/Heron
- Apache Apex
- Apache Samza

APACHE SPARK (STREAMING)

Typical Use: distributed, large-scale data processing; micro-batching

Why Spark Streaming?

- Micro-batching creates very low latency, which can be faster
- Well defined role means it fits in well with other pieces of the pipeline

DISTRIBUTED STORAGE

NoSQL

- ArangoDB
- mongoDB
- Apache Cassandra
- Apache HBase

SQL

- MemSQL

Filesystems

- Quobyte
- HDFS

Time-Series Datastores

- InfluxDB
- OpenTSDB
- KairosDB
- Prometheus

see also iot-a.info

APACHE CASSANDRA

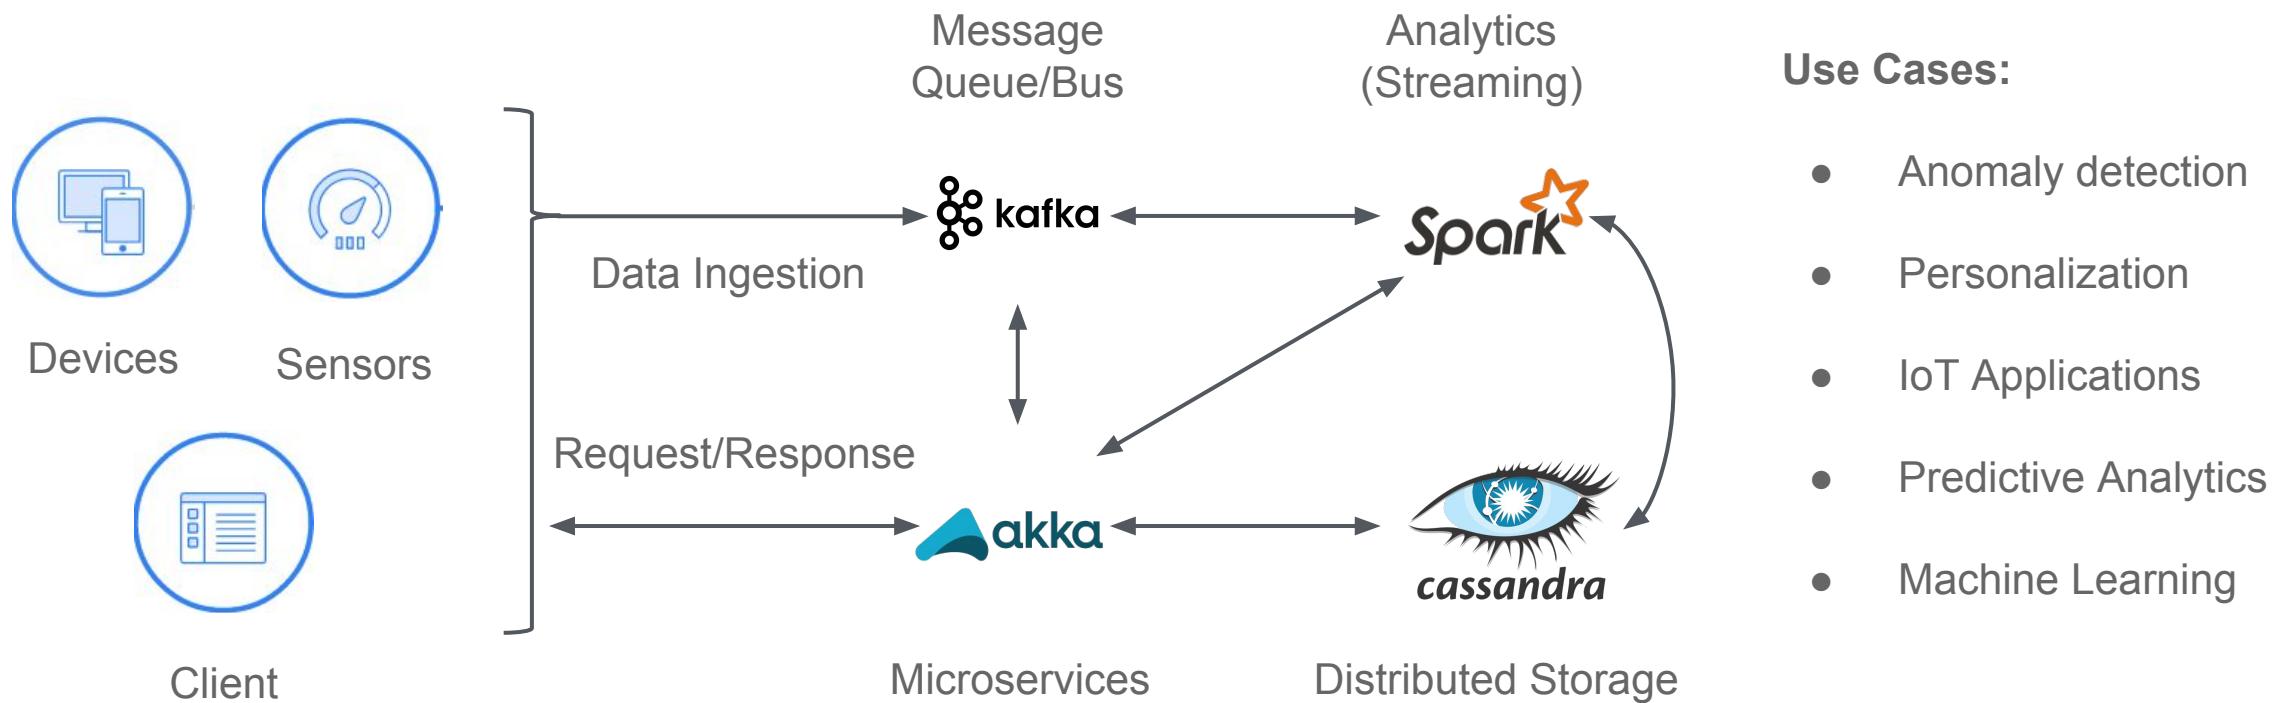

Typical Use: No-dependency, time series database

Why Cassandra?

- A top level Apache project born at Facebook and built on Amazon's Dynamo and Google's BigTable
- Offers continuous availability, linear scale performance, operational simplicity and easy data distribution

A GOOD STACK ...

how do we operate
these distributed
systems?

**most organizations have many stateless
independent (micro)services, the
distributed systems I'm talking about here
are ...**

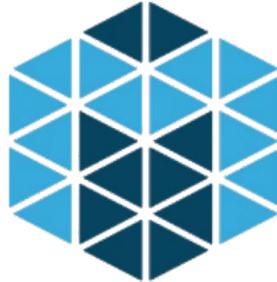

A word cloud visualization on a black background containing various terms related to distributed systems and consensus algorithms. The words are colored in shades of blue, orange, and white, and are arranged in a non-linear, overlapping pattern.

The most prominent words include:

- consensus** (large, white)
- consistency** (large, blue)
- replication** (large, orange)
- nondeterministic** (large, orange)
- partition** (large, blue)
- failure** (large, orange)
- availability** (large, blue)
- state** (medium, white)
- latency** (medium, orange)
- dynamic** (medium, blue)
- unreliable** (medium, blue)
- cap** (medium, orange)
- eventual** (medium, blue)
- backpressure** (medium, blue)
- limiting** (medium, orange)
- performance** (medium, blue)
- administrators** (medium, blue)
- bandwidth** (medium, orange)
- power** (medium, orange)
- multiple** (medium, orange)
- stateful** (medium, orange)
- insecure** (medium, orange)
- scalability** (medium, blue)
- paxos** (large, orange)
- theorem** (medium, blue)
- topology** (medium, blue)
- tolerance** (large, blue)
- synchronous** (medium, blue)
- high** (medium, blue)
- tor** (medium, orange)
- rate** (medium, orange)
- fault** (medium, orange)
- clients** (medium, blue)
- switch** (medium, blue)
- partial** (medium, blue)
- idempotence** (medium, blue)
- network** (medium, blue)

*how do we scale the
operations of
distributed systems?*

SMACK STACK

Apache Spark: distributed, large-scale data processing

Apache Mesos: cluster resource manager

Akka: toolkit for message driven applications

Apache Cassandra: distributed, highly-available database

Apache Kafka: distributed, highly-available messaging system

distributed systems
are *hard* to operate

DATA & ANALYTICS DAY 2 OPS CHALLENGES

- Bare metal storage (or someone else's problem)
- Drive down job latency and drive up utilization
- Run multiple versions simultaneously
- Upgrade complicated data systems

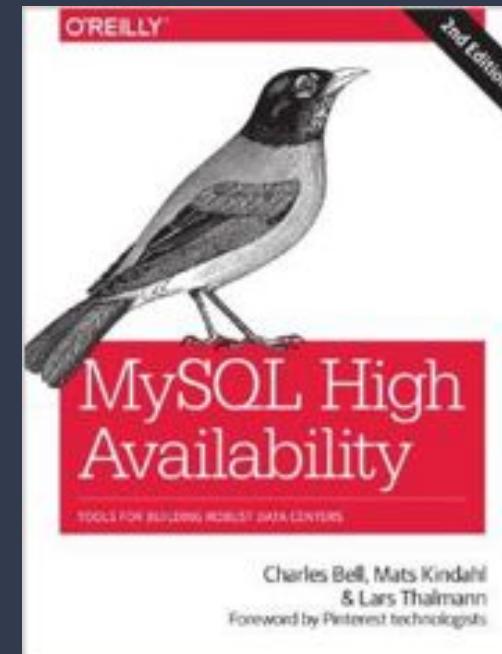

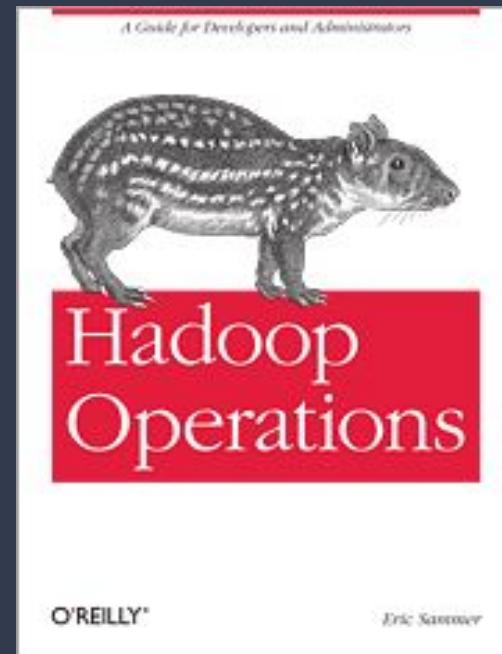

- 1: download
- 2: deploy
- 3: monitor
- 4: maintain
- 5: upgrade → goto 1

-
- 1: download
 - 2: deploy
 - 3: monitor
 - 4: maintain
 - 5: upgrade → goto 1

fault tolerance
+ **high availability**
+ **latency**
+ **bandwidth**
+ **CPU/mem resources**
+ ...

= **configuration**

-
- 1: download**
 - 2: deploy**
 - 3: monitor**
 - 4: maintain**
 - 5: upgrade → goto 1**

-
- 1: download**
 - 2: deploy**

 - 2: deploy**
 - 3: monitor**
 - 4: maintain**
 - 5: upgrade → goto 1**

then, debug again ...

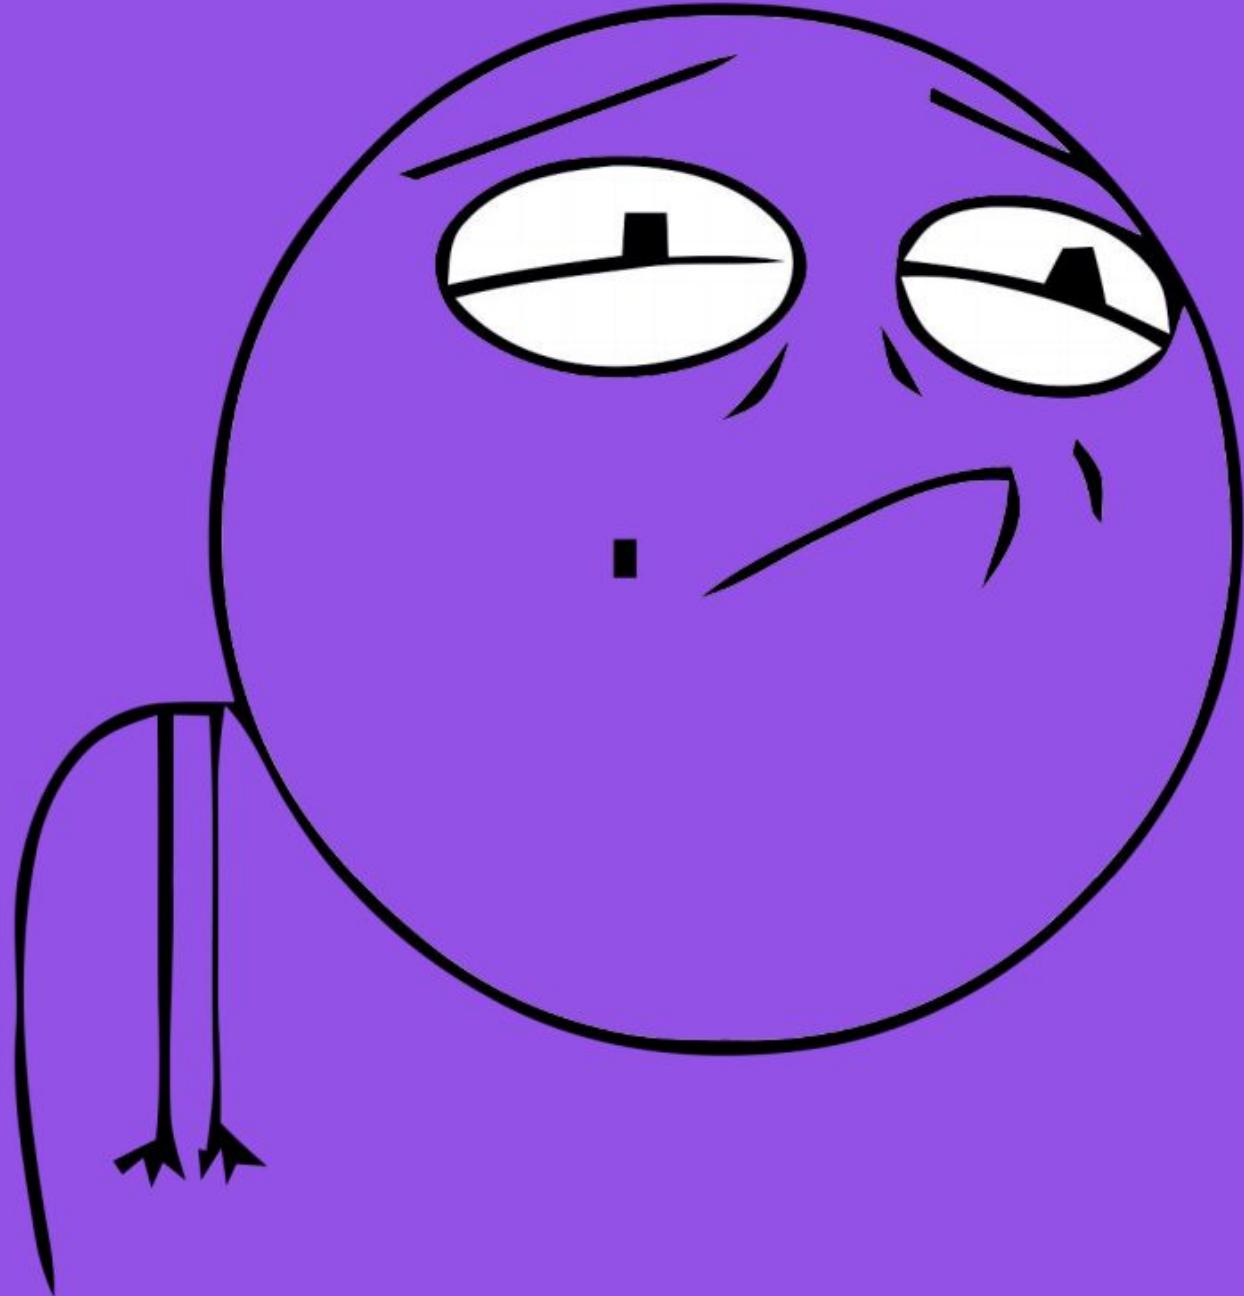

-
- 1: download**
 - 2: deploy**
 - 3: monitor**
 - 4: maintain**
 - 5: upgrade → goto 1**

finally, write code so it never happens again ...

-
- 1: download**
 - 2: deploy**
 - 3: monitor**
 - 4: maintain**
 - 5: upgrade → goto 1**

thesis:
distributed systems should
(be able to) operate themselves;
deploy, monitor, upgrade ...

why:

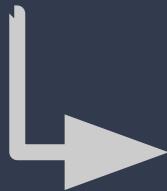

(1) operators have *inadequate knowledge* of distributed system needs/semantics
to make optimal decisions

why:

(1) operators have *inadequate knowledge* of distributed system needs/semantics
to make optimal decisions
(even after reading the book)

why:

(2) execution needs/semantics can't easily or efficiently be expressed to underlying system, and vice versa

(1) express

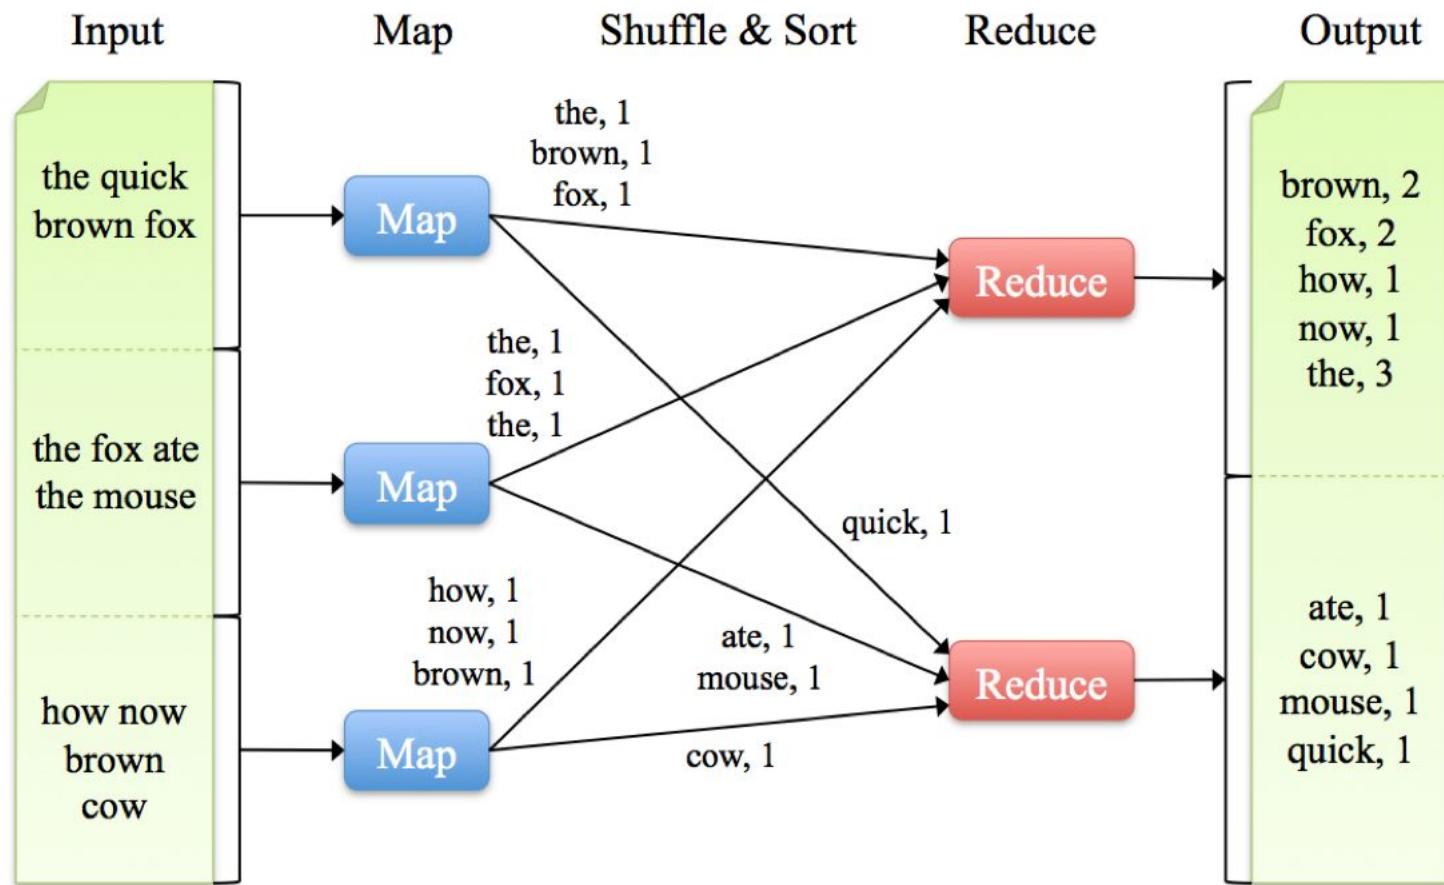

```
INSTALL.SH
#!/bin/bash

pip install "$1" &
easy_install "$1" &
brew install "$1" &
npm install "$1" &
yum install "$1" & dnf install "$1" &
docker run "$1" &
pkg install "$1" &
apt-get install "$1" &
sudo apt-get install "$1" &
steamcmd +app_update "$1" validate &
git clone https://github.com/"$1"/"$1" &
cd "$1";./configure;make;make install &
curl "$1" | bash &
```

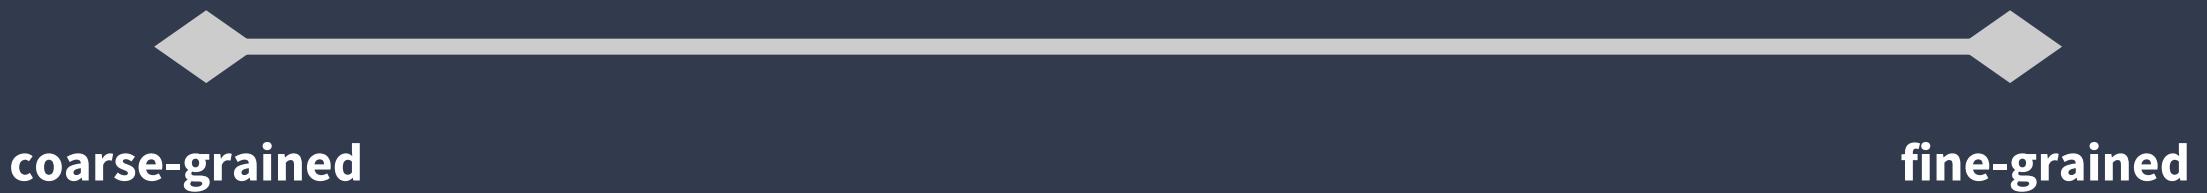

(2) orchestrate

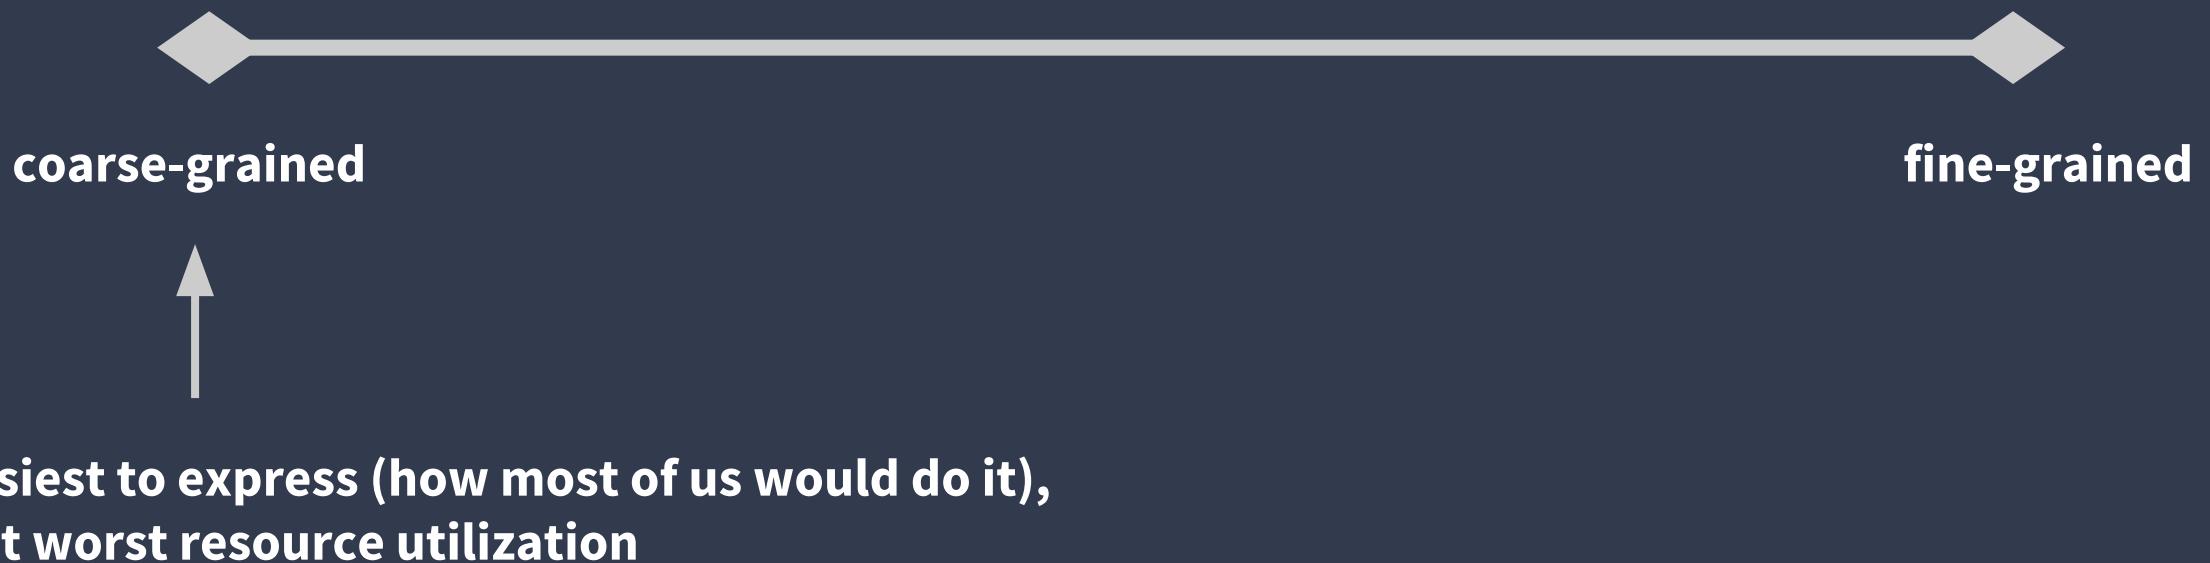

configuration spectrum:

configuration spectrum:

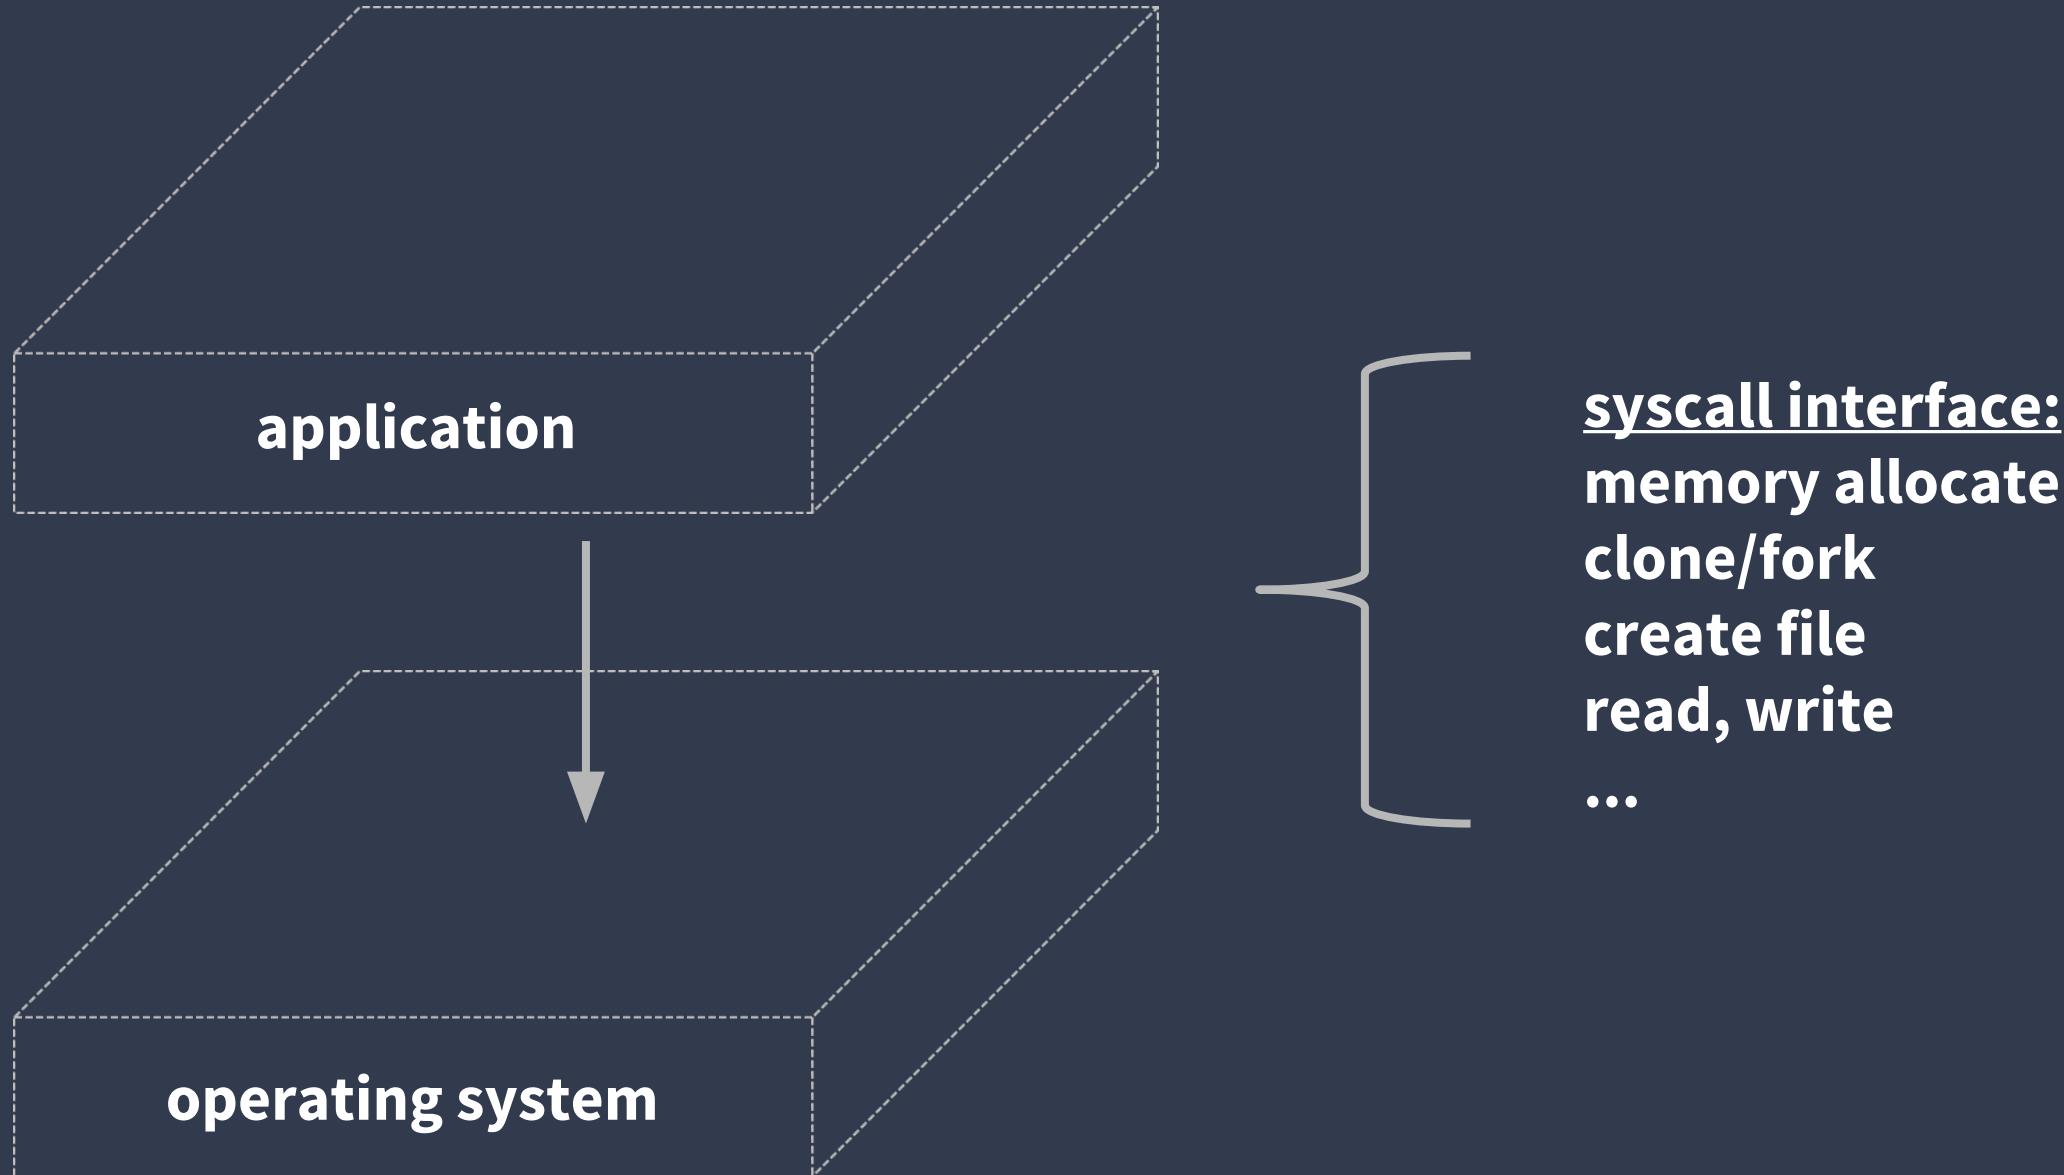

configuration spectrum:

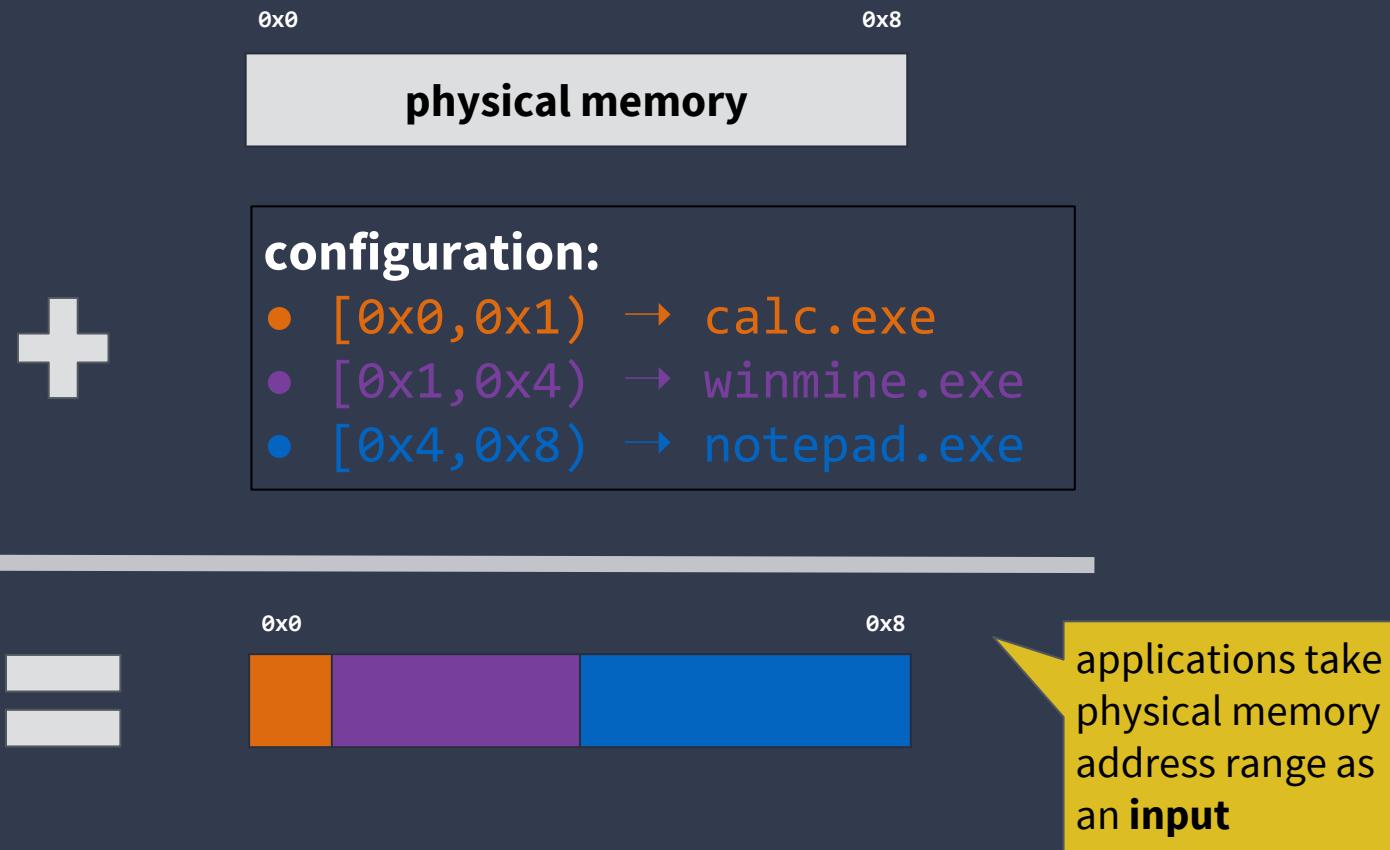

why can't Hadoop decide this for me?

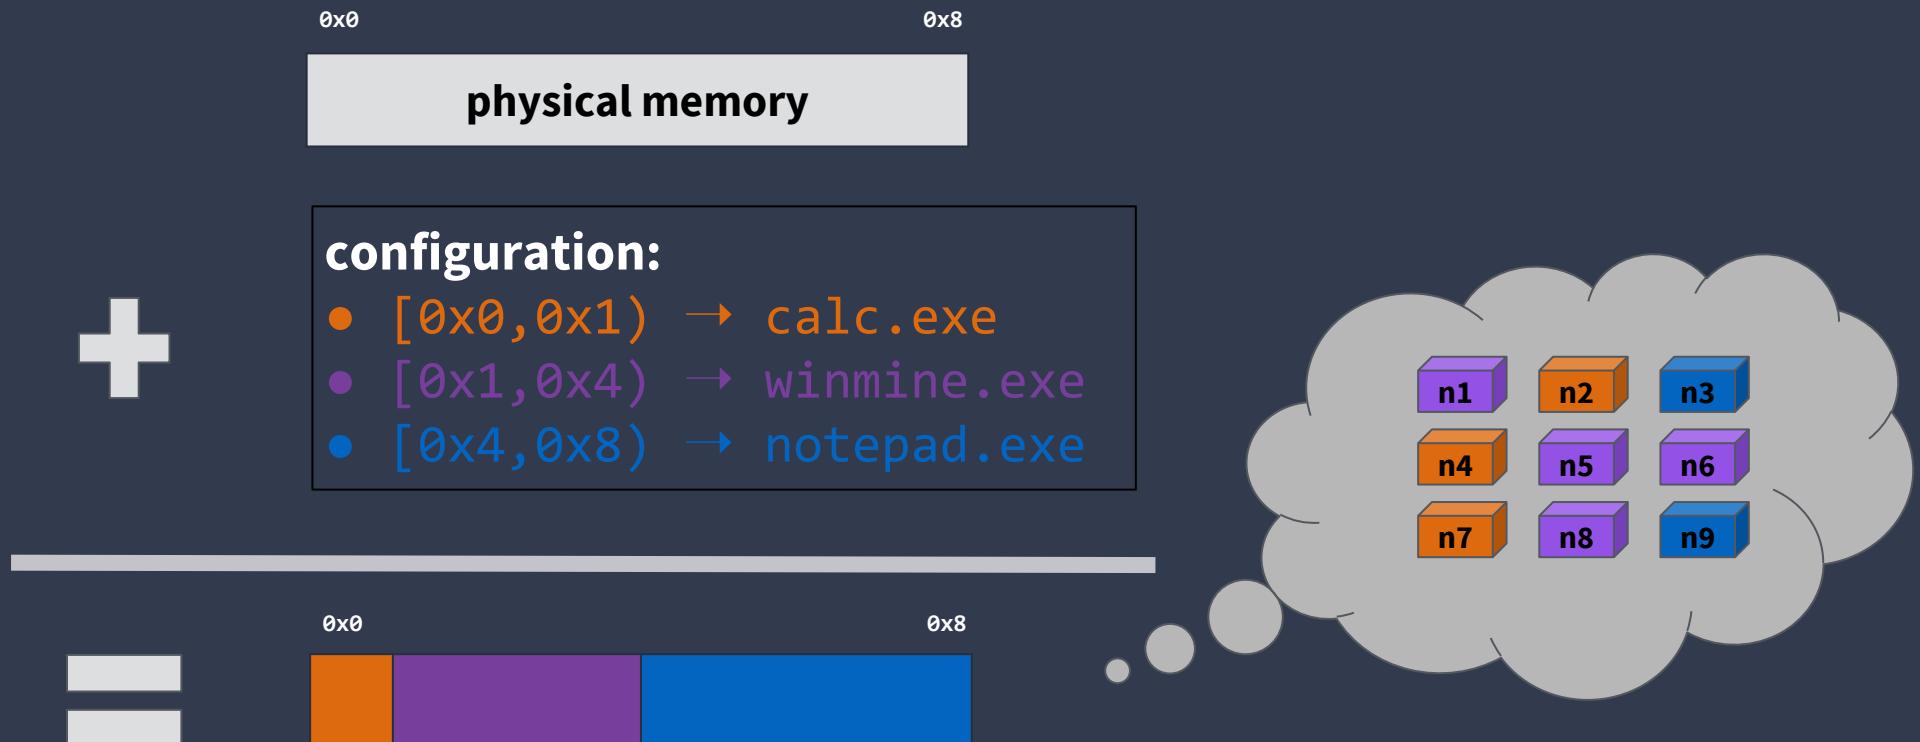

applications “operate” themselves on Linux; when an application needs to “scale up” it asks the operating system to allocate more memory or create another thread ...

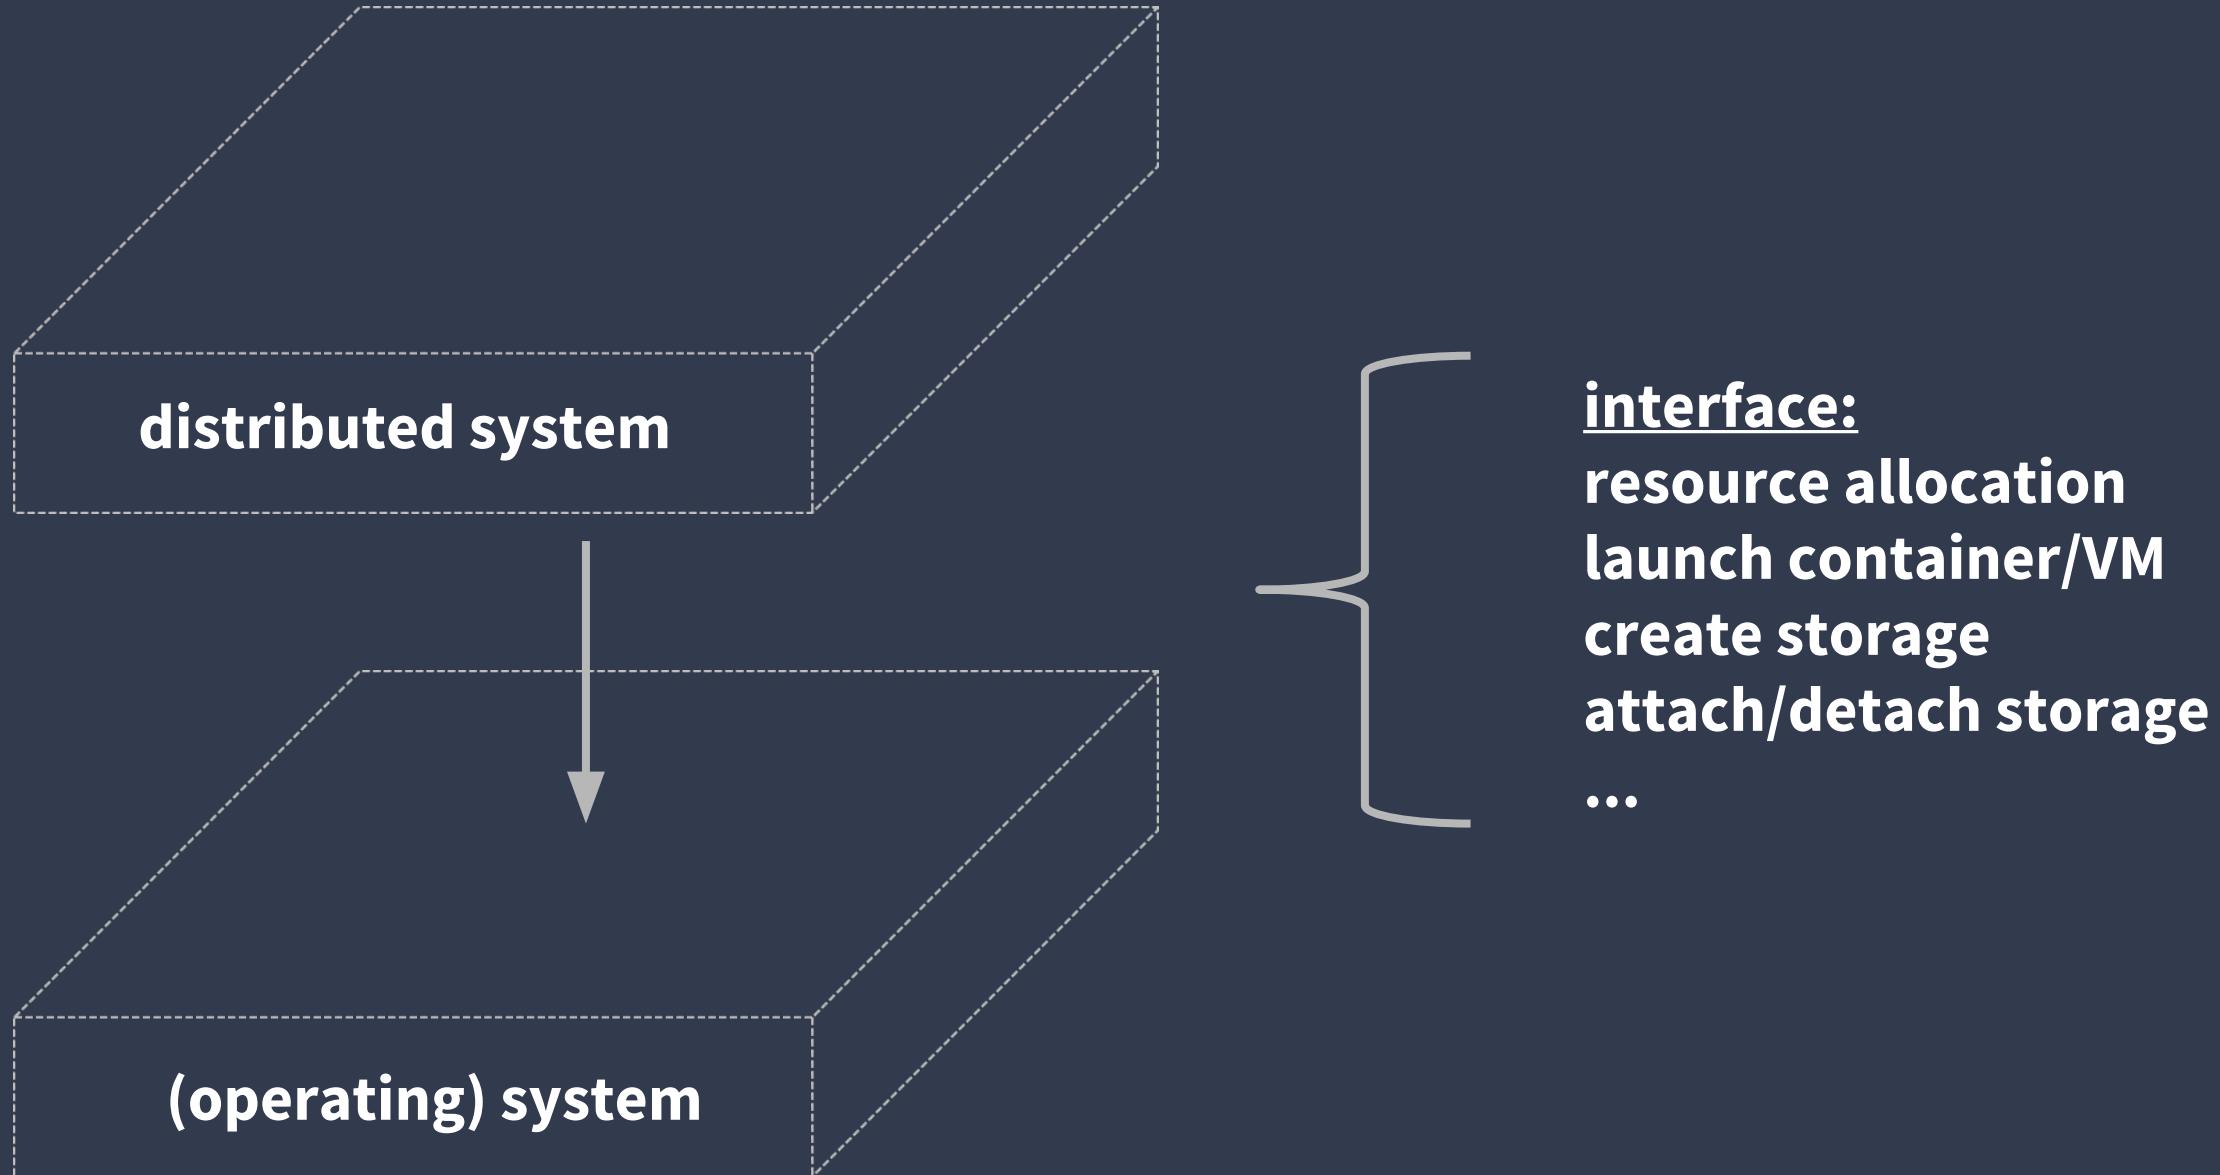

once upon a time ... before virtual memory

once upon a time ... before virtual memory

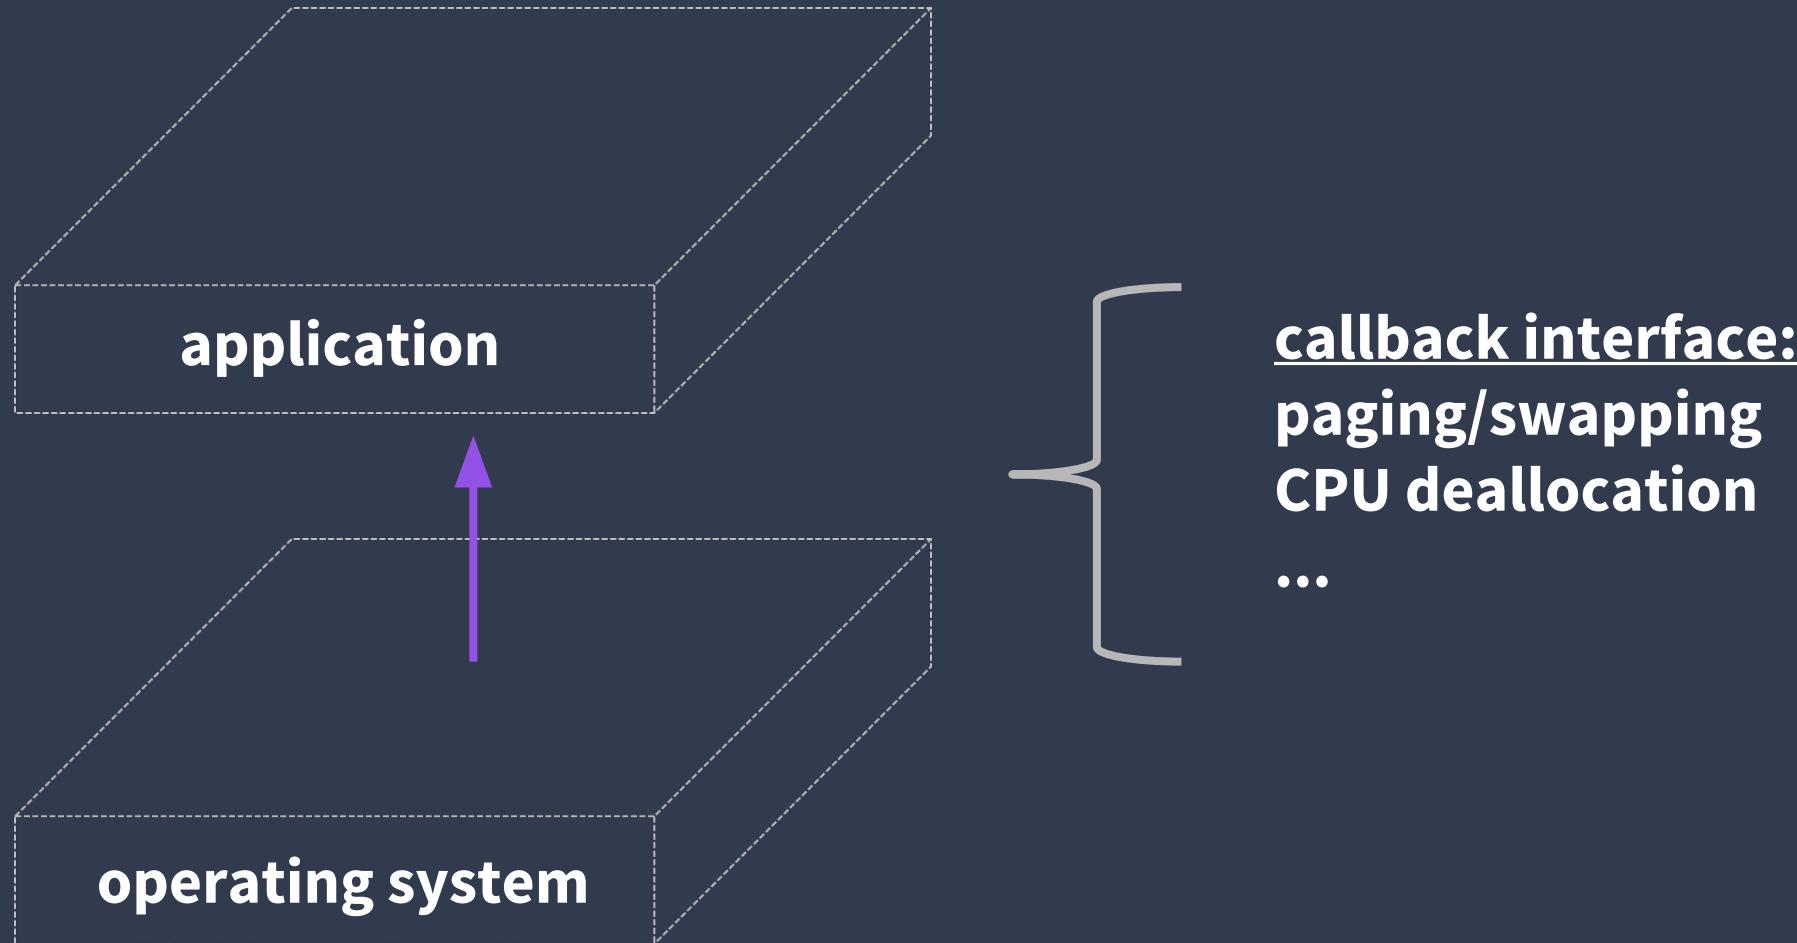

how:
distributed systems need
interface to communicate
with underlying system,
and vice versa

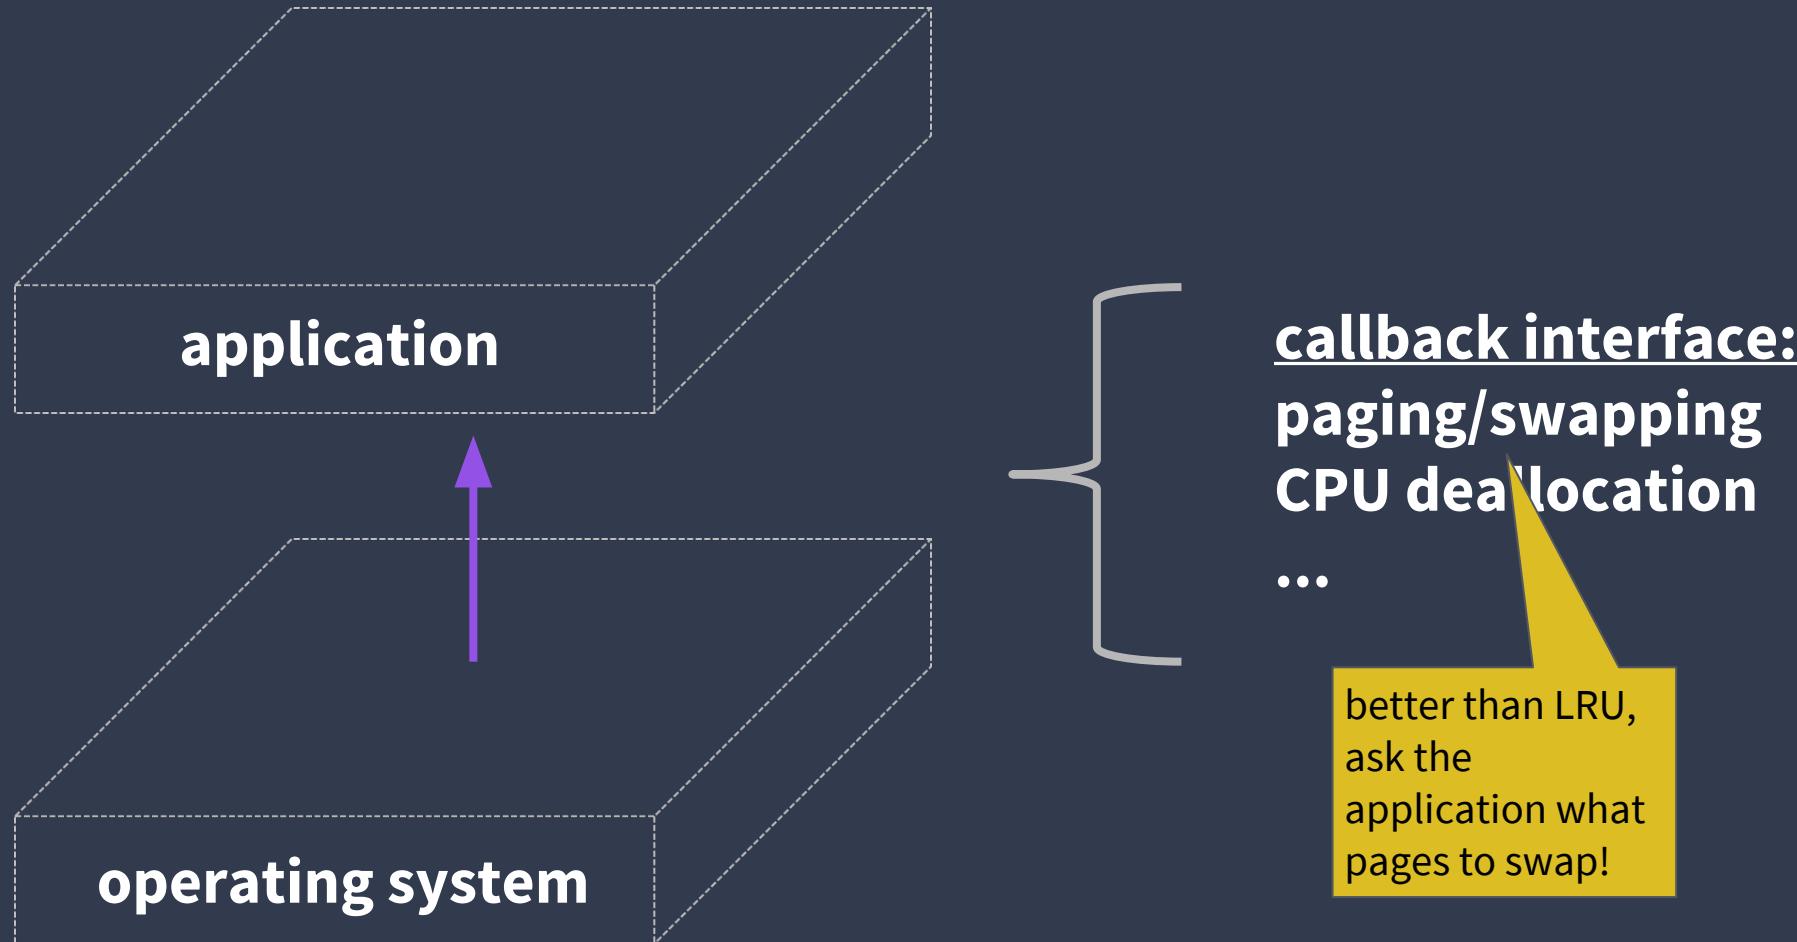

vice versa:
operating system should
be able to *callback* into
application

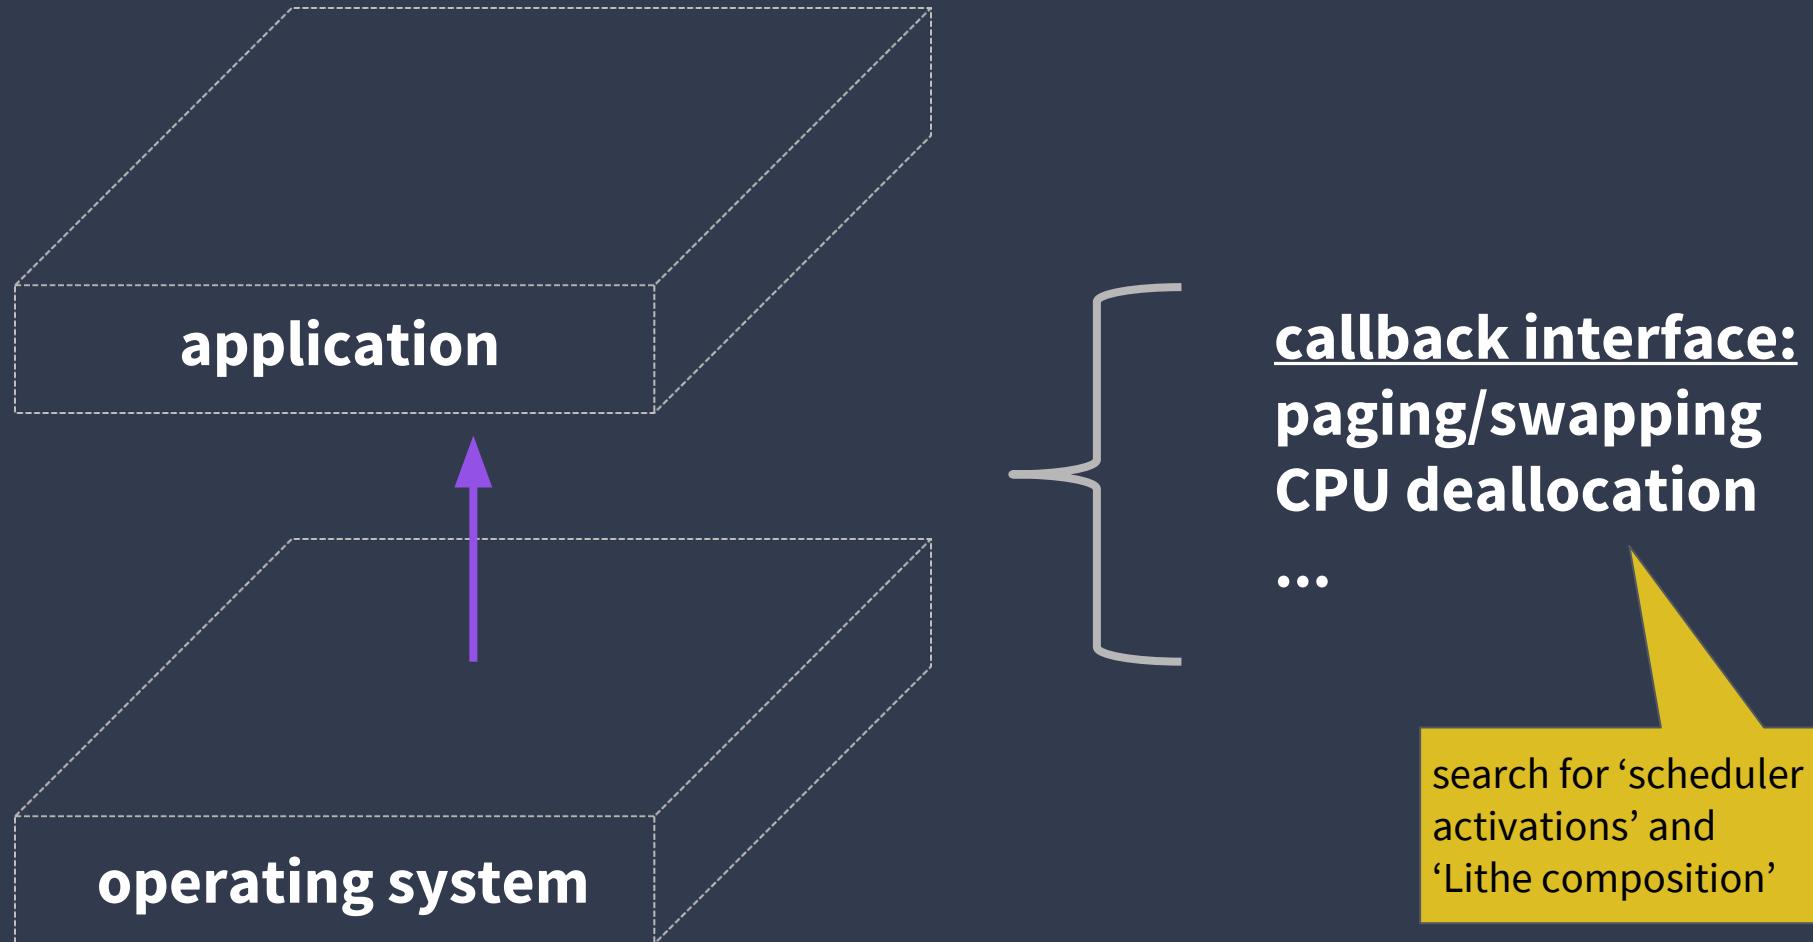

learning from history ... bidirectional interface

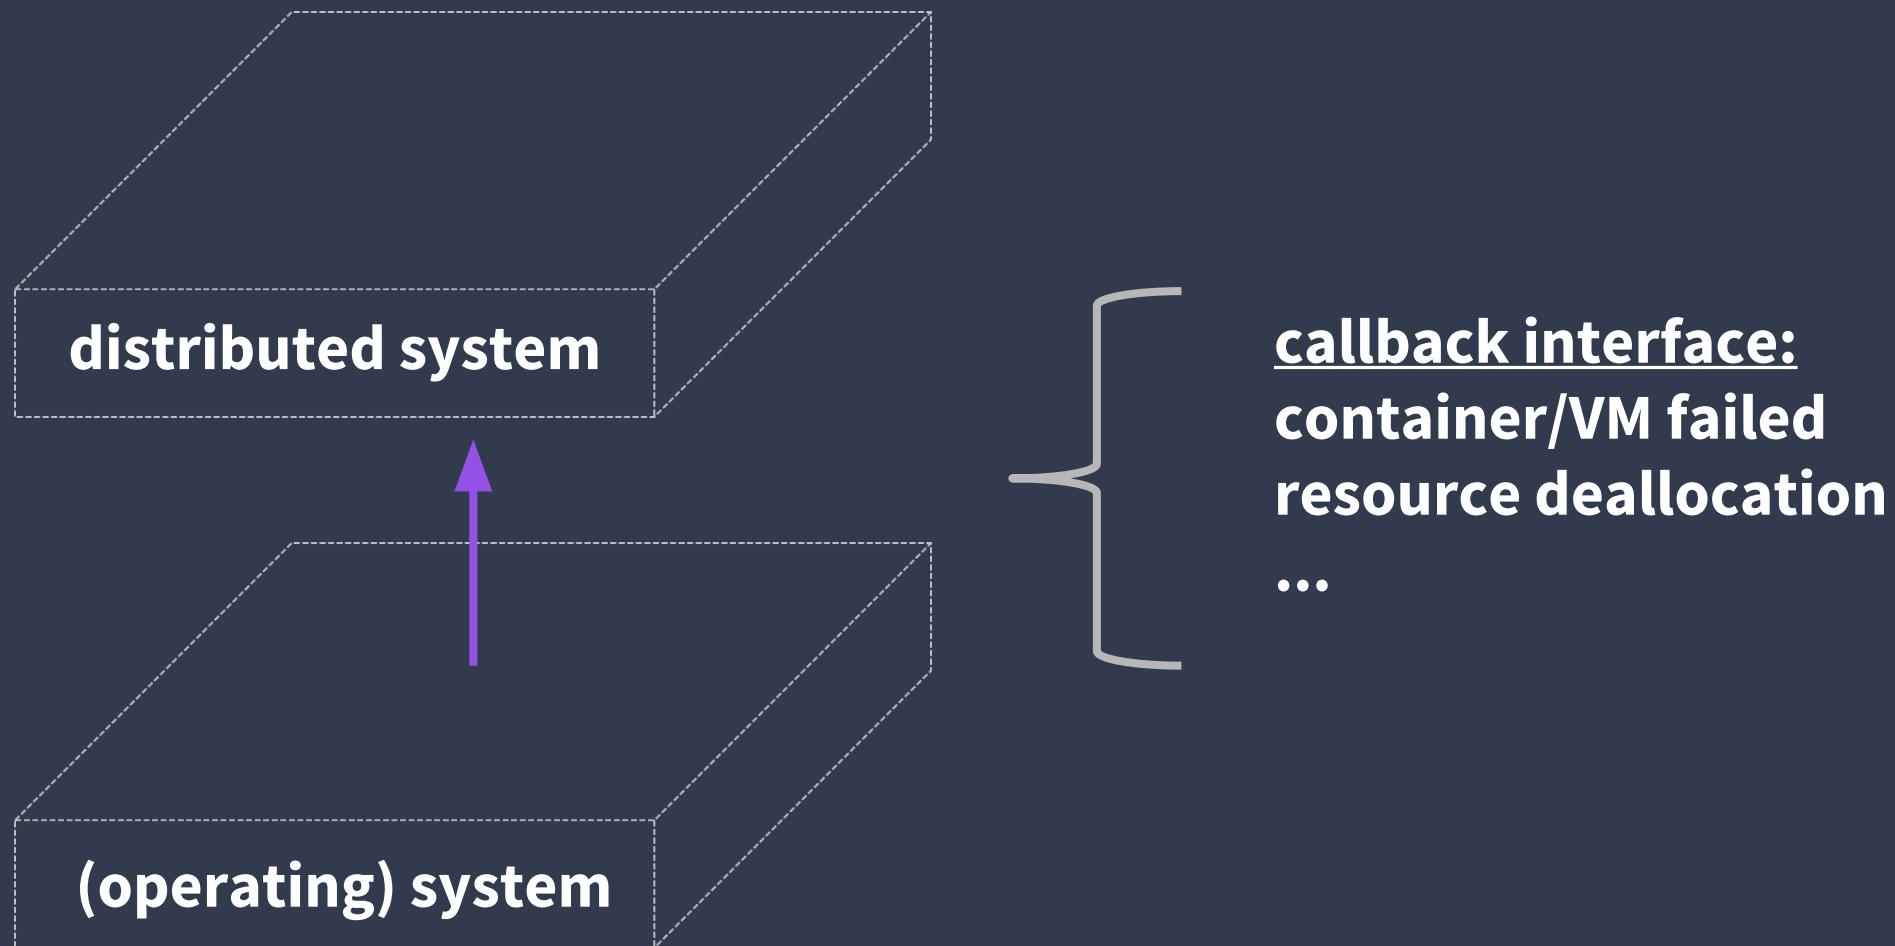

learning from history ... bidirectional interface

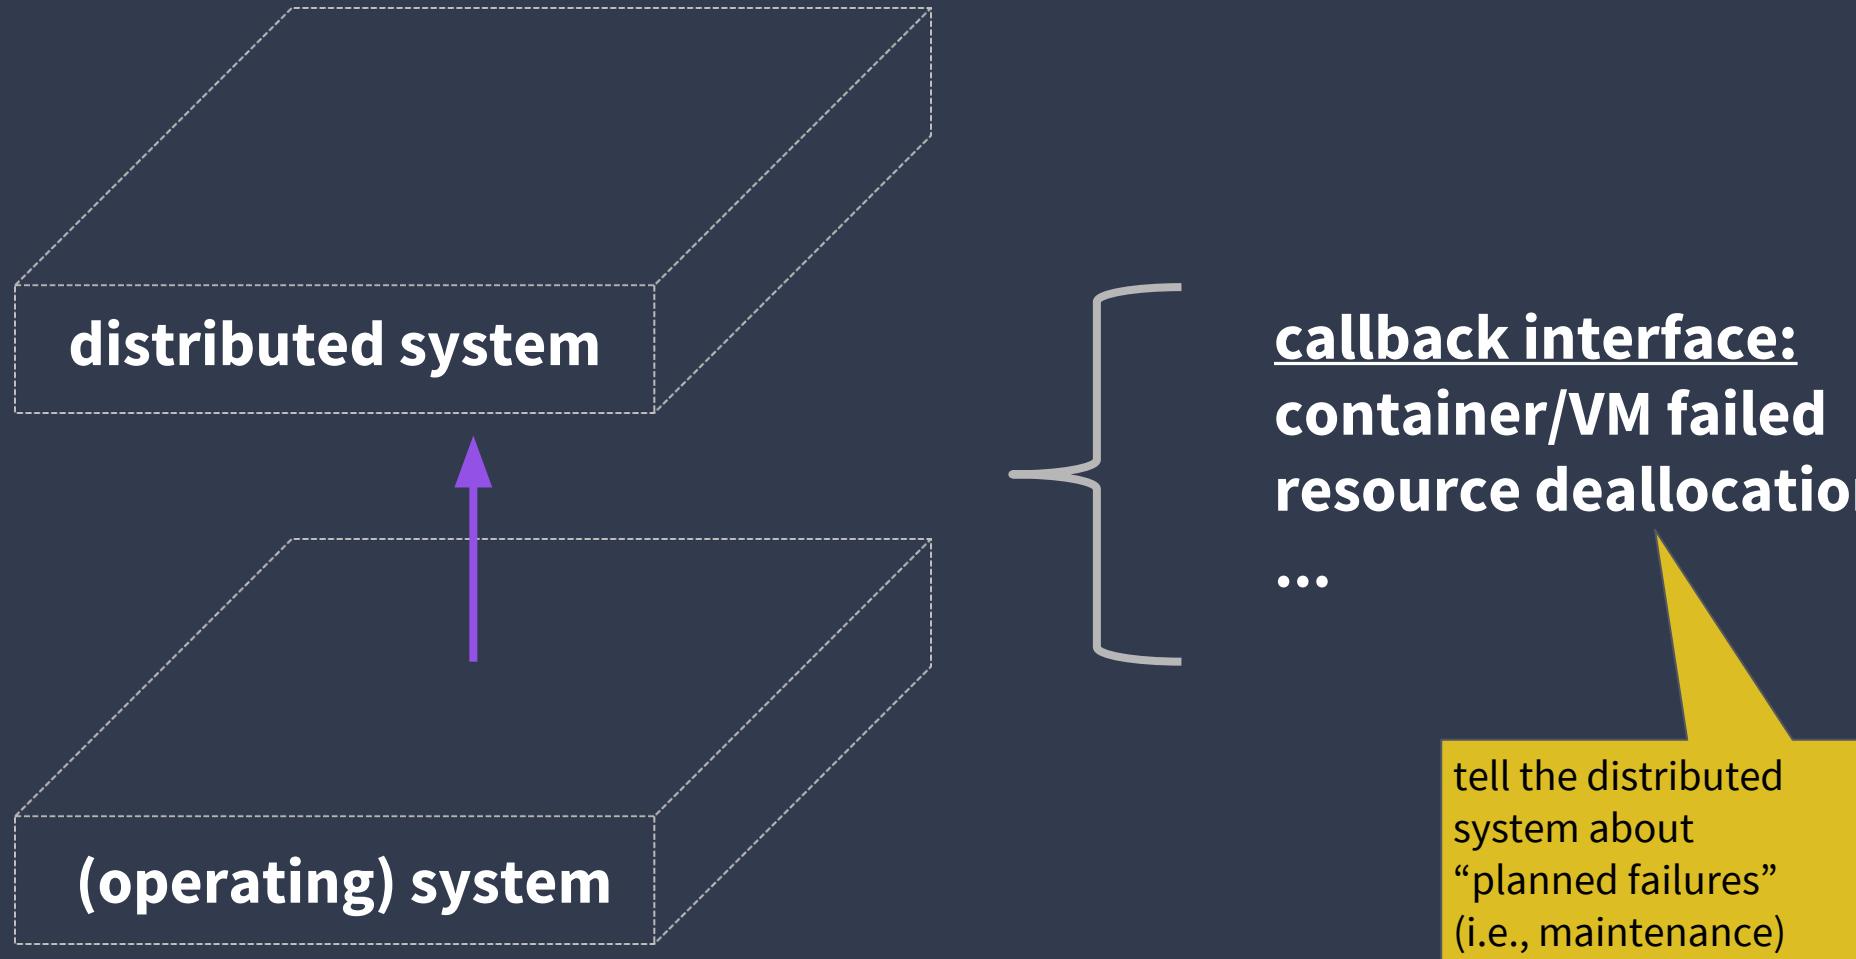

learning from history ... bidirectional interface

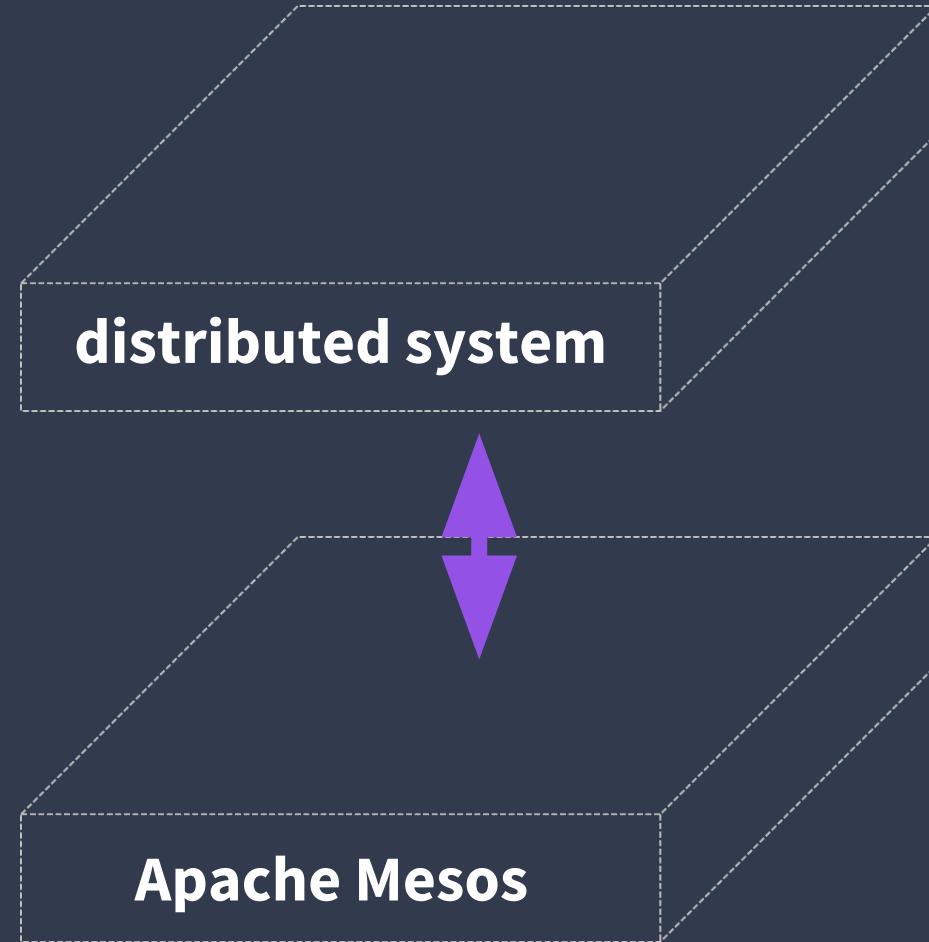

distributed systems need bidirectional interface too

distributed systems need bidirectional interface too

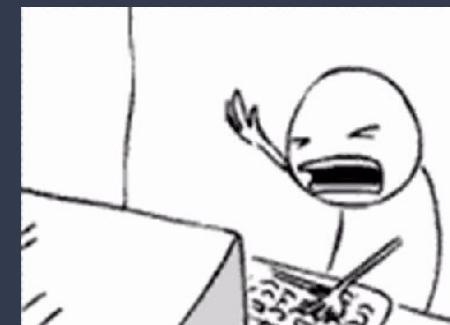

Apache Mesos

Dogfooding: Apache Spark

reality is people are
(already) building software
that *operates* distributed
systems ...

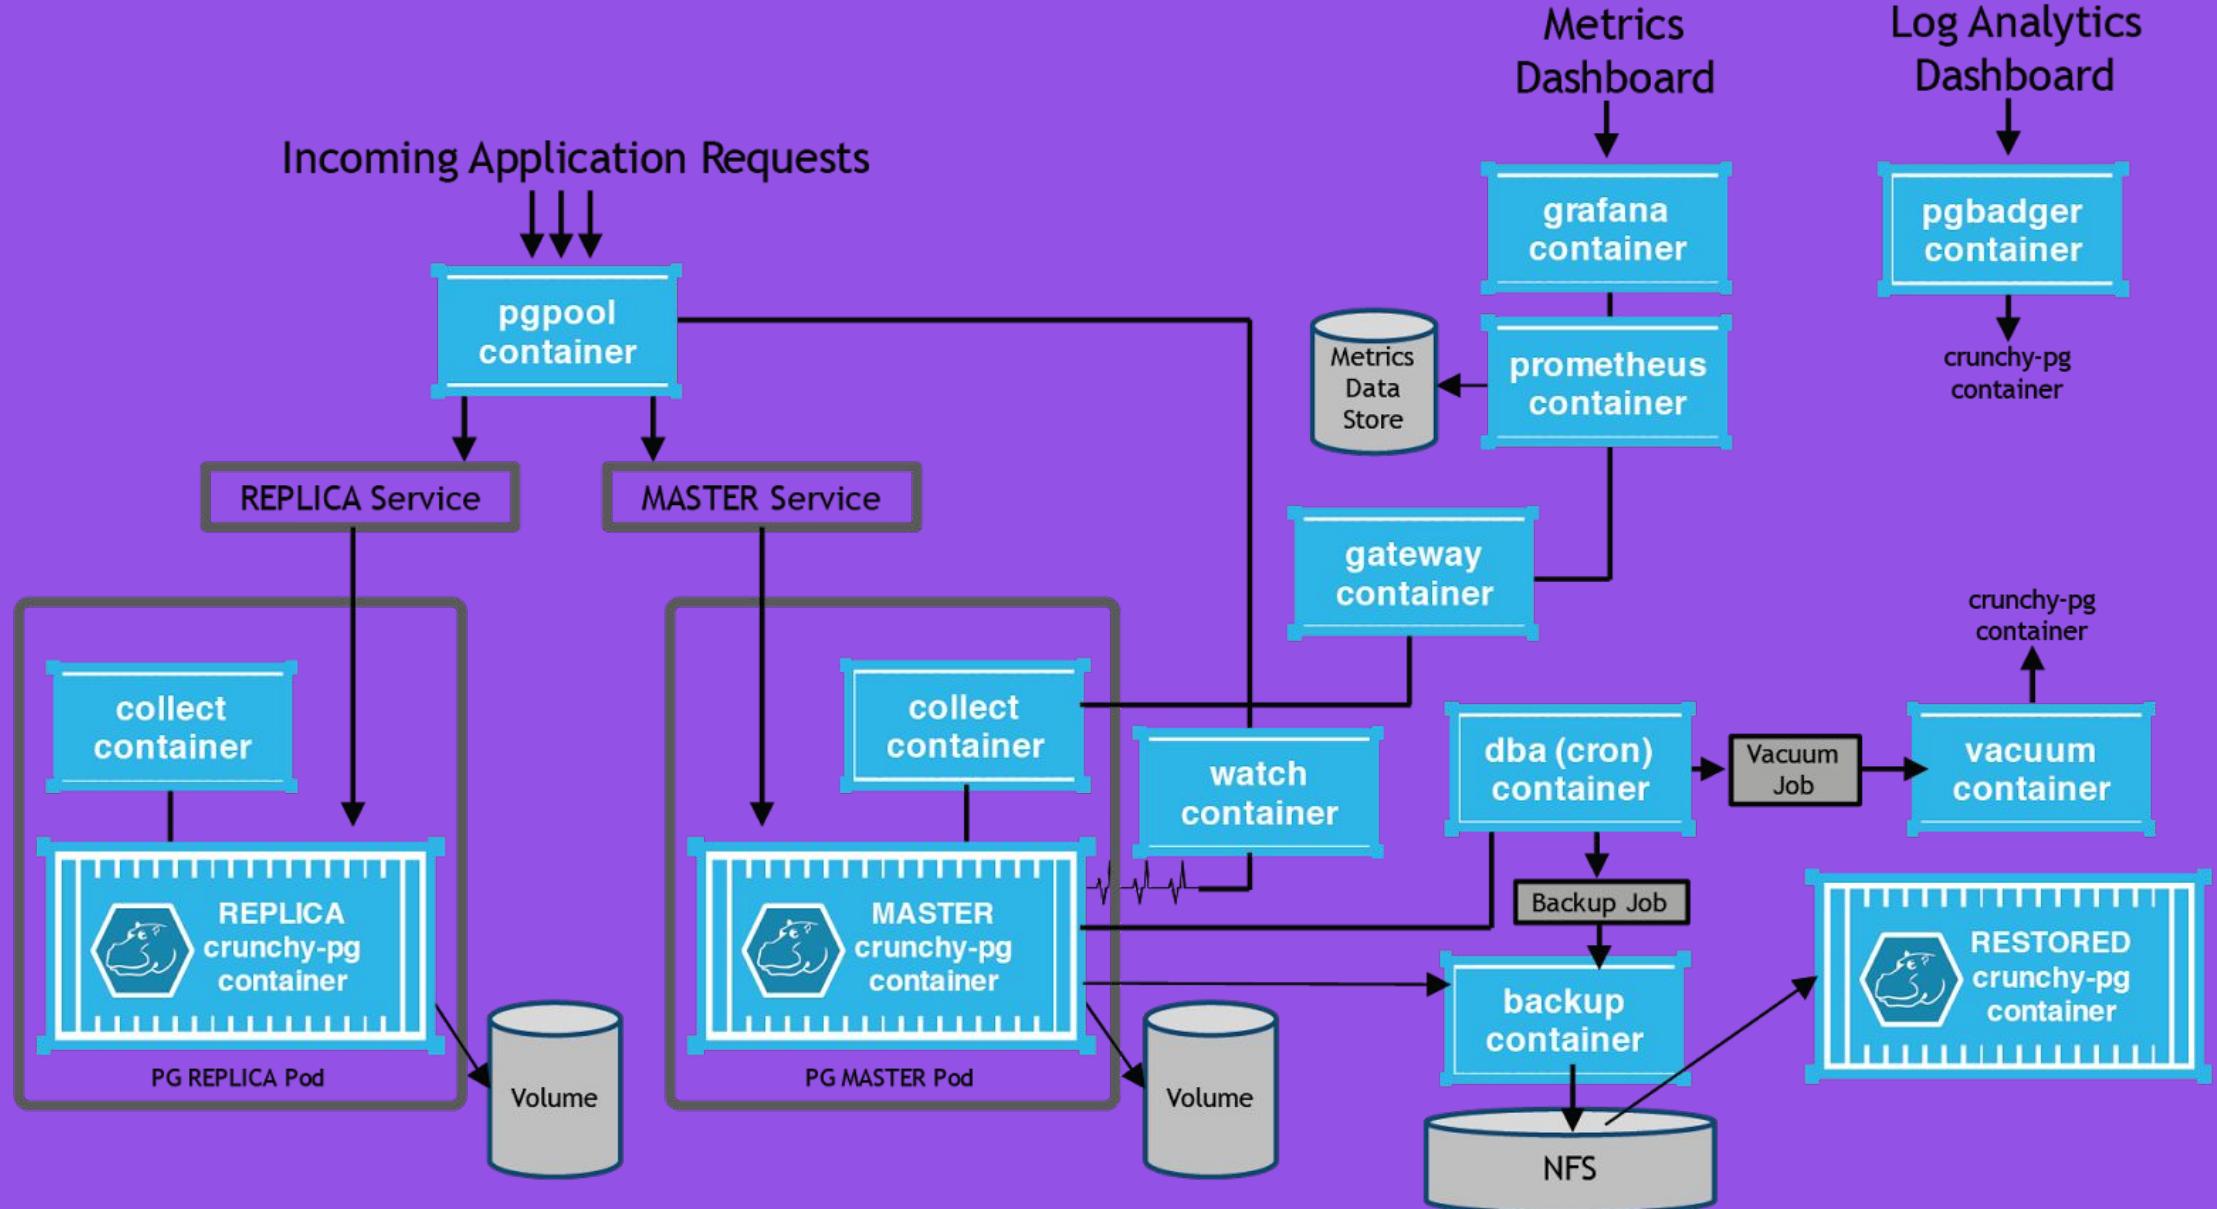

common pattern: ad hoc control planes

goal: provide *distributed system** as software as a service (SaaS) to the rest of your internal organization or to sell to external organizations

solution: a *control plane* built out of ad hoc scripts, ancillary services, etc, that deploy, maintain, and upgrade said SaaS

* e.g., analytics via Spark, message queue via Kafka, key/value store via Cassandra

```
$ kubectl create -f $LOC/kitchensink-master-service.json  
$ kubectl create -f $LOC/kitchensink-slave-service.json  
$ kubectl create -f $LOC/kitchensink-pgpool-service.json  
$ envsubst < $LOC/kitchensink-sync-slave-pv.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-master-pv.json | kubectl create -f -  
$ kubectl create -f $LOC/kitchensink-sync-slave-pvc.json  
$ kubectl create -f $LOC/kitchensink-master-pvc.json  
$ envsubst < $LOC/kitchensink-master-pod.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-slave-dc.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-sync-slave-pod.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-pgpool-rc.json | kubectl create -f -  
$ kubectl create -f $LOC/kitchensink-watch-sa.json  
$ envsubst < $LOC/kitchensink-watch-pod.json | kubectl create -f -
```

```
$ kubectl create -f $LOC/kitchensink-master-service.json  
$ kubectl create -f $LOC/kitchensink-slave-service.json  
$ kubectl create -f $LOC/kitchensink-pgpool-service.json  
$ envsubst < $LOC/kitchensink-sync-slave-pv.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-master-pv.json | kubectl create -f -  
$ kubectl create -f $LOC/kitchensink-sync-slave-pvc.json  
$ kubectl create -f $LOC/kitchensink-master-pvc.json  
$ envsubst < $LOC/kitchensink-master-pod.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-slave-dc.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-sync-slave-pod.json | kubectl create -f -  
$ envsubst < $LOC/kitchensink-pgpool-rc.json | kubectl create -f -  
$ kubectl create -f $LOC/kitchensink-watch-sa.json  
$ envsubst < $LOC/kitchensink-watch-pod.json | kubectl create -f -
```

what happens if there's a bug in the control plane?

what if my control plane has diverged from yours?

what happens when a new release of the distributed system invalidates an assumption the control plane previously made?

a better world ...

control planes should be built into the distributed systems itself by the experts who built the distributed system in the first place!

as an industry we should strive to build a standard interface that distributed systems can leverage

vice versa:

**abstractions exist for good reasons, but
without sufficient communication they
force sub-optimal outcomes ...**

a better world ...

control planes should be built into distributed systems themselves by the experts who built the distributed system in the first place!

as an industry we should strive to build a standard interface distributed systems can leverage

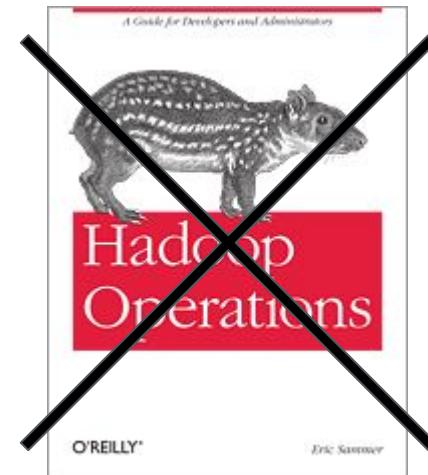

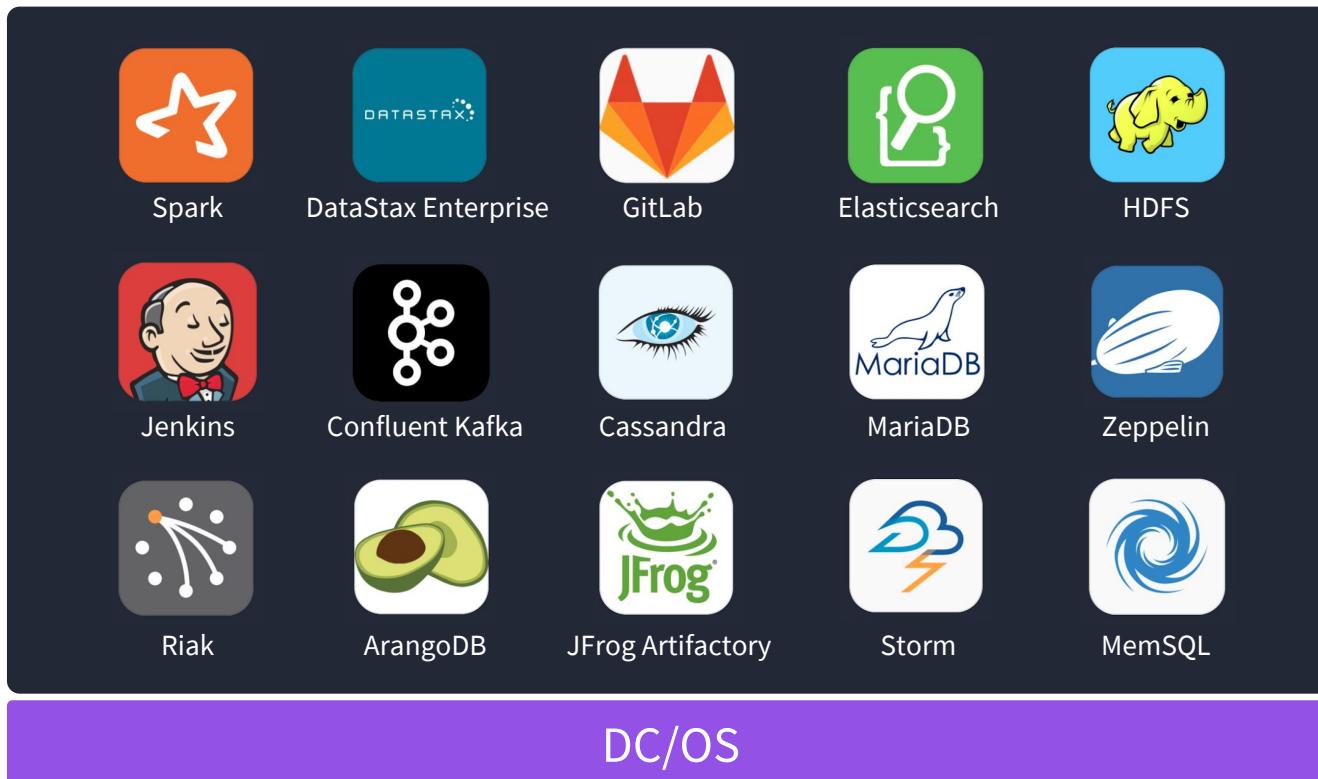

our standard interface should be bidirectional to avoid sub-optimal outcomes

**how do we scale the operations
of distributed systems?**

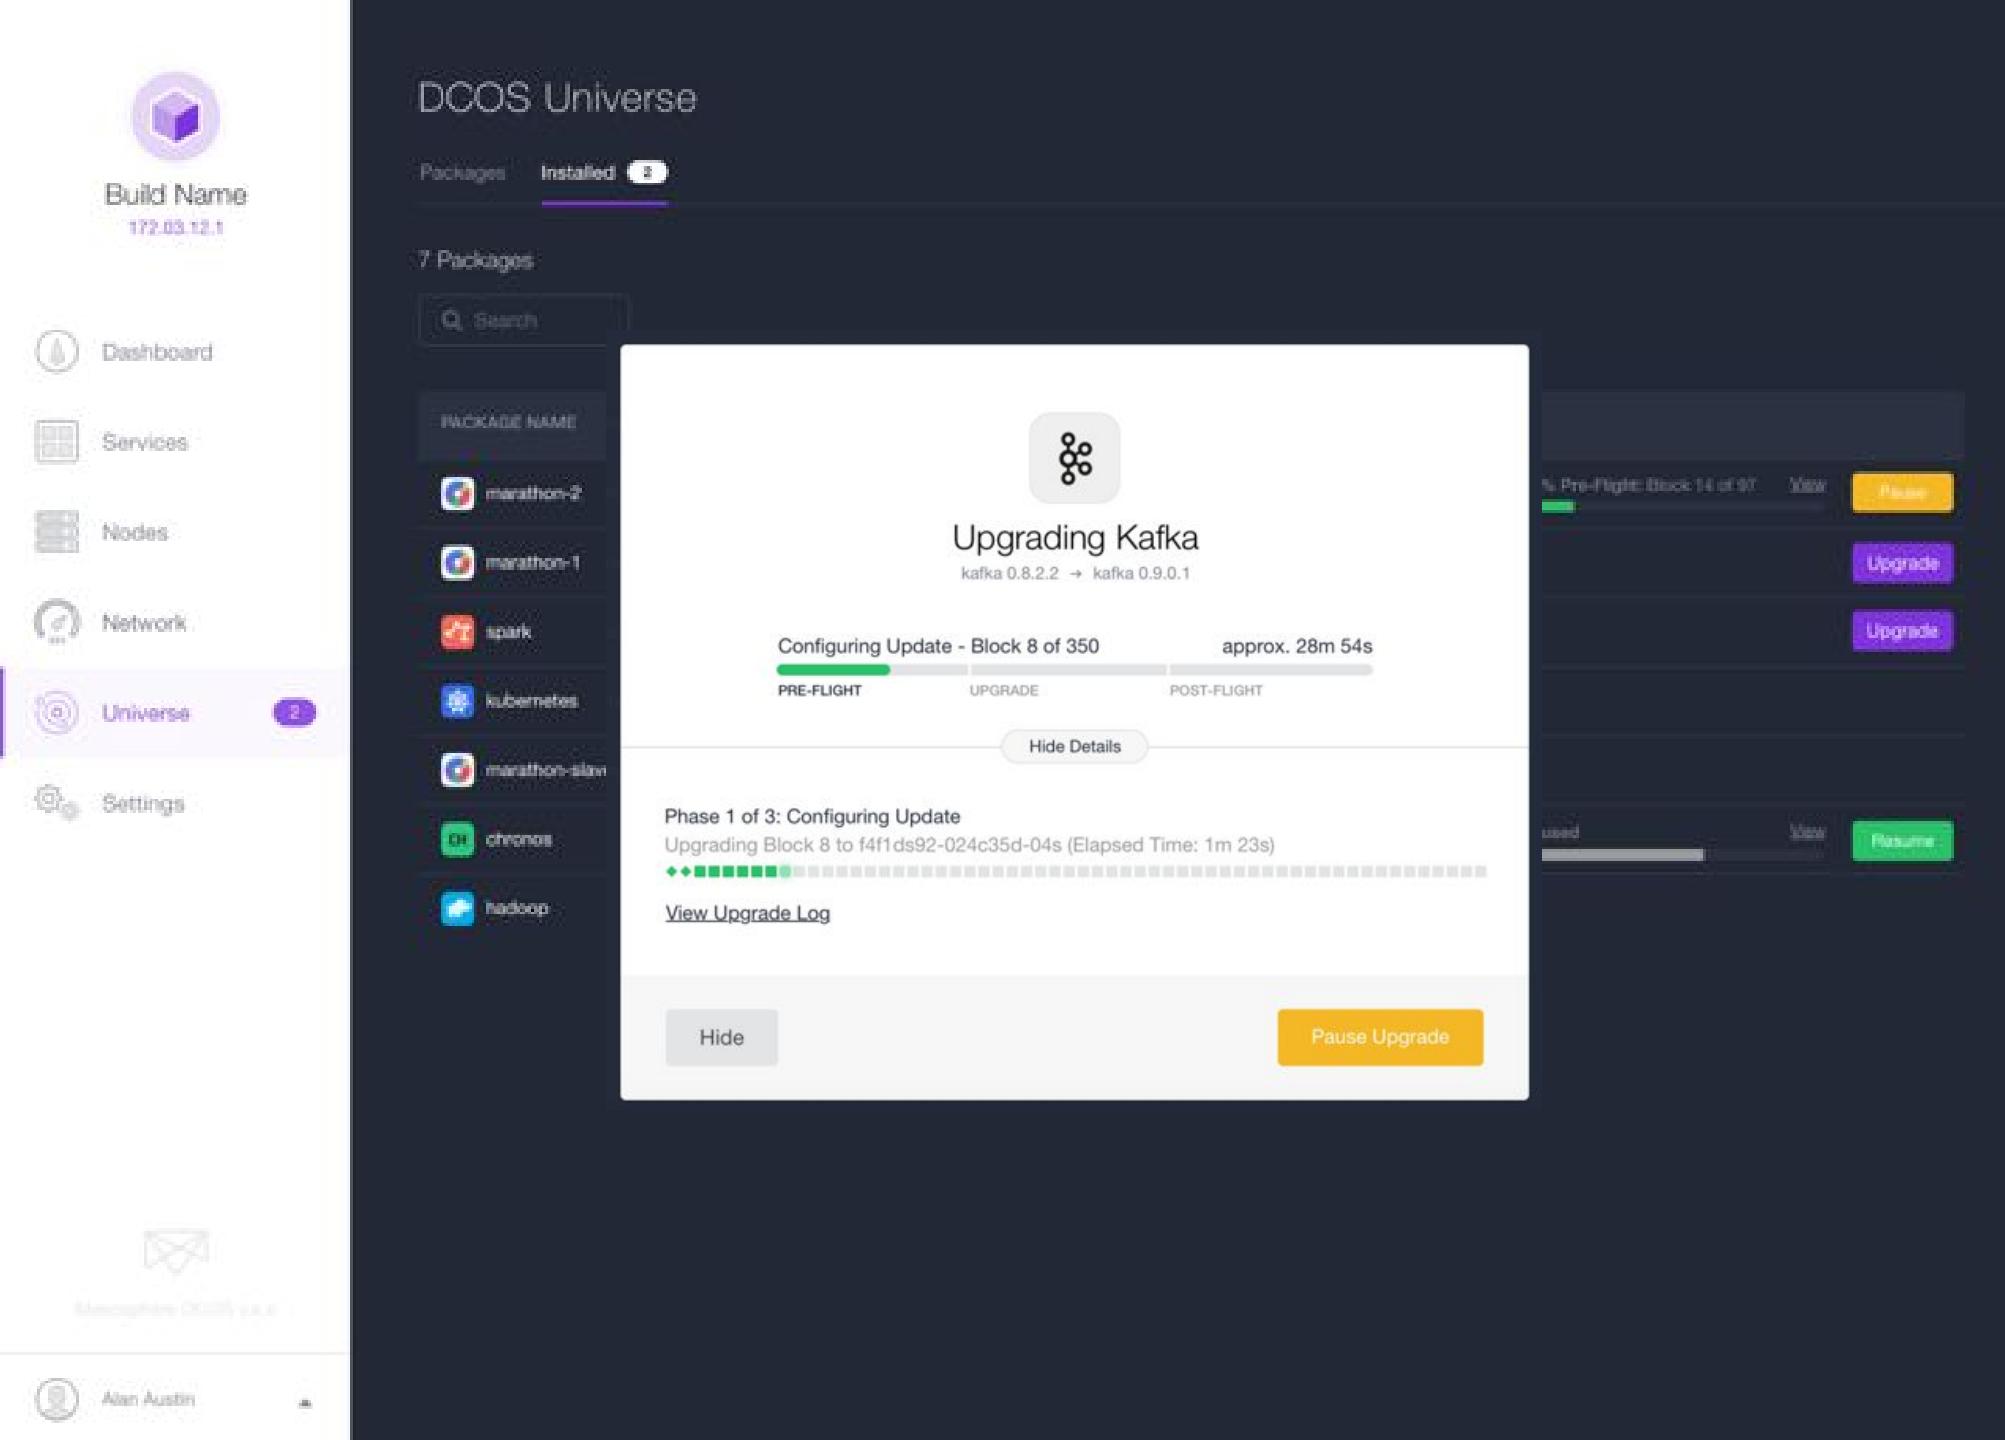

let them *scale* themselves!
